Document Title	GV600MG @Track Air Interface Protocol
Version	1.03
Date	2020-07-27
Status	Released
Document Control ID	QSZTRACGV600MGAN0103

General Notes

Queclink offers this information as a service to its customers, to support application and engineering efforts that use the products designed by Queclink. The information provided is based upon requirements specifically provided to Queclink by the customers. Queclink has not undertaken any independent search for additional relevant information, including any information that may be in the customer's possession. Furthermore, system validation of this product designed by Queclink within a larger electronic system remains the responsibility of the customer or the customer's system integrator. All specifications supplied herein are subject to change.

0. Revision History

Version	Date	Author	Description of Change
1.00	2019-12-19	Beck Wan	Initial 1. Modify +RESP:GTRSS report example. 2. Modify <Index> functional description in "AT+GTBAS" command. 3. Modify +RESP:GTBAA/BID report examples. 4. Modify <Accessory Model> in +RESP:GTERI. 5. Modify <Main Server IP> description in AT+GTSRI.
1.01	2020-04-07	Beck Wan	1. Add 'GSM Deep Charge Mode' in AT+GTCFG. 2. Add "APN Authentication Methods" in AT+GTBSI. 3. Add "Sub Command Parameter" in AT+GTRTO. 4. Modify "Read Interval" in AT+GTBAS.
1.02	2020-06-30	Beck Wan	1. Delete AT+GTBTE Command. 2. Delete +RESP:GTBST/BTA report. 3. Delete "WTS300" in AT+GTBAS. 4. Add "WTH300" in AT+GTBAS. 5. Delete "DMS" description in AT+GTRTO. 6. Add "GNSS Fix Failure Timeout" in AT+GTGAM.
1.03	2020-07-27	Ted Li	1. Add AT+GTIEX, AT+GTOEX, AT+GTAEX. 2. Add HEX Ack: GTIEX, GTOEX. 3. Add GTRTO read command mask: GTIEX, GTOEX, GTAEX. 4. Modify ERI-RESP. 5. Add "WBC300" in AT+GTBAS. 6. Add RESP:DOS, DIS, AIS report ID type to support extended IO of Bluetooth access. 7. Add GTFVR read command mask: GTIEX, GTOEX, GTAEX. 8. i-Button supports DR200 RFID reader.

1. Overview

1.1. Scope of This Document

The @Track Air Interface Protocol, a digital communication interface based on printable ASCII characters over SMS or network, is used for communication between the backend server and the terminal. The backend server sends a command to the terminal and then the terminal confirms with an acknowledgement message. If necessary, the terminal also sends messages to the backend server.

The purpose of this document is to describe how to build up the backend server based on the @Track Air Interface Protocol.

1.2. Terms and Abbreviations

Abbreviation	Description
APN	Access Point Name
ASCII	American National Standard Code for Information Interchange
GSM	Global System for Mobile Communication
HDOP	Horizontal Dilution of Precision
ICCID	Integrated Circuit Card Identity
IMEI	International Mobile Equipment Identity
IP	Internet Protocol
LTE	Long Term Evolution
RSSI	Received Signal Strength Indication
SMS	Short Message Service
TCP	Transmission Control Protocol
UDP	User Datagram Protocol
UTC	Coordinated Universal Time

2. System Architecture

The backend server can be accessed by multiple terminals and it should have the following abilities:

- ✧ The backend server should be able to access the internet and monitor the connection originating from the terminal.
- ✧ The backend server should be able to support TCP or UDP connection with the terminal. It should be able to receive data from the terminal and send data to the terminal.
- ✧ The backend server should be able to receive and send SMS.

3. Message Description

3.1. Message Format

All of the @Track Air Interface Protocol messages are composed of printable ASCII characters. Each message has the following format:

Message format	Message type
AT+GTXXX=<parameter1>,<parameter2>,...\$	Command
+ACK:GTXXX,<parameter1>,<parameter2>,...\$	Acknowledgement
+RESP:GTXXX,<parameter1>,<parameter2>,...\$	Report

The entire message string ends with character '\$'.

The characters 'XXX' identify the transmitted messages.

The "<parameter1>,<parameter2>,..." carries the message's parameters. The number of parameters is different in different messages. The ASCII character ',' is used to separate the neighboring parameter characters. The parameter string may contain the ASCII characters: '0'-'9', 'a'-'z', 'A'-'Z'.

Detailed descriptions of each message format are located in the specific message sections.

The backend server can either configure and query the parameters of the terminal or control the terminal to perform specific actions by sending Commands to the terminal. When the terminal receives Commands over the air, it will reply with a corresponding Acknowledgement message.

The device can send other Reports to the server by configuring related parameters. Please see the following figure:

Figure 1: @Tracker Protocol messages flow

3.2. Command and Acknowledgement

3.2.1. Server Connection

3.2.1.1. Bearer Setting Information

The command **AT+GTBSI** is used to configure the parameters for network data connection.

➤ **AT+GTBSI=**

Example: AT+GTBSI=gv600mg,,,,,,,,0,2,0,FFFF\$				
SN	Parameter	Length (Byte)	Range/Format	Default
1	Password	4 – 7	'0' – '9' 'a' – 'z' 'A' – 'Z'	gv600mg
2	LTE APN	<=64		
3	LTE APN User Name	<=30		
4	LTE APN Password	<=30		
5	GPRS APN	<=64		
6	GPRS APN User Name	<=30		
7	GPRS APN Password	<=30		
8	Network Mode/APN Authentication Methods	2	00--33	00
9	LTE Mode	1	0-3	2
10	Manual Netreg	1	0-1	0
	Serial Number	4	0000 – FFFF	
	Tail Character	1	\$	\$

- ✧ <Password>: The valid character of password is '0'–'9', 'a' –'z', 'A' –'Z'. The default value is "gv600mg".
- ✧ <LTE APN>: Access point name (LTE APN).
- ✧ <LTE APN User Name>: The LTE APN user name. If the parameter field is empty, the current value of this parameter will be cleared.
- ✧ <LTE APN Password>: The LTE APN Password. If the parameter field is empty, the current value of this parameter will be cleared.
- ✧ <GPRS APN>: The GPRS access point name. If the <LTE APN> does not useful, the <GPRS APN> will be used.
- ✧ <GPRS APN User Name>: The GPRS APN user name. If the parameter field is empty, the current value of this parameter will be cleared.
- ✧ <GPRS APN Password>: The GPRS APN password. If the parameter field is empty, the current value of this parameter will be cleared.

- ✧ **<Network Mode/APN Authentication Methods>**: This field is in hex format. 4 high bits mean APN authentication methods and 4 low bits mean network mode.

Mobile network modes of the device:

- 0: Auto. (LTE & GSM)
- 1: GSM only.
- 2: LTE only.
- 3: GSM First. (LTE & GSM)

Mobile APN authentication methods of the device:

- 0: No authentication.
- 1: PAP authentication.
- 2: CHAP authentication.
- 3: PAP or CHAP authentication.

- ✧ **<LTE Mode>**: Select Cat-M1 and Cat-NB1 work mode.

- 0: Cat-M1 first (Cat-M1 & Cat-NB1).
- 1: Cat-NB1 first (Cat-NB1 & Cat-M1).
- 2: Cat-M1.
- 3: Cat-NB1.

- ✧ **<Manual Netreg>**: Manually register the network selection.

- 0: Disable manually register the network.
- 1: Enable manually register the network.

- ✧ **<Serial Number>**: The serial number for the command. It will be included in the ACK message of the command.

- ✧ **<Tail Character>**: A character to indicate the end of the command. And it must be "\$".

The acknowledgment message of **AT+GTBSI** command:

➤ **+ACK:GTBSI,**

Example:

+ACK:GTBSI,DC0100,862170019025640,,0000,20140511093254,11F0\$

Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXXFFF, X ∈ {'A' – 'Z', '0' – '9'}	
Unique ID	15/12	IMEI/MUID	
Device Name	<=20	'0' – '9' 'a' – 'z' 'A' – 'Z' '-' '_'	
Serial Number	4	0000 – FFFF	
Send Time	14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

- ✧ **<Protocol Version>**: The protocol version that the terminal conforms to. The first two characters point out the device type. As in the example, "**DC**" means gv600mg. The middle two characters point out the major version number of the protocol and the last two

characters point out the minor version number of the protocol. All version numbers are hex digits. For example, “**0100**” means version 1.00.

- ✧ <Unique ID>: The IMEI/MUID of the terminal.
- ✧ <Device Name>: The specified name of the device.
- ✧ <Serial Number>: A serial number which is included in the corresponding command to distinguish which command the ACK message is for.
- ✧ <Send Time>: The local time to send the ACK message.
- ✧ <Count Number>: A self-increasing count number in each acknowledgment message and other messages. It counts from 0000 and increases by 1 for each message. And it rolls back after “FFFF”.
- ✧ <Tail Character>: A character to indicate the end of the command. And it must be “\$”.

Note:

Only after both of the command **AT+GTBSI** and **AT+GTSRI** are properly set can the ACK messages and other messages be sent to the backend server.

3.2.1.2. Backend Server Register Information

The command **AT+GTSRI** is used to configure where and how to report the messages such as the server information and the communication method between the backend server and the terminal.

➤ AT+GTSRI=

Example:

```
AT+GTSRI=gv600mg,3,,1,116.226.44.17,7011,116.226.45.229,7012,+8613812341234,15,1,,,,,0001$
```

```
AT+GTSRI=gv600mg,3,,1,some.host.name,7011,116.226.45.229,7012,+8613812341234,15,1,,0001$
```

SN	Parameter	Length (Byte)	Range/Format	Default
1	Password	4 – 7	'0' – '9' 'a' – 'z' 'A' – 'Z'	gv600mg
2	Report Mode	1	0 – 7	0
3	Reserved	0		
4	Buffer Mode	1	0 1 2	1
5	Main Server IP/Domain Name	<=60		
6	Main Server Port	<=5	0 – 65535	
7	Backup Server IP/Domain Name	<=60		
8	Backup Server Port	<=5	0 – 65535	

9	SMS Gateway	<=20		
10	Heartbeat Interval	<=3	0 5 – 360min	0
11	SACK Enable	1	0 1 2	0
12	Protocol Format	1	0 1	0
13	SMS ACK Enable	1	0 1	0
14	Reserved	0		
15	Reserved	0		
	Serial Number	4	0000 – FFFF	
	Tail Character	1	\$	\$

✧ *<Report Mode>*: This defines the communication method between the backend server and the terminal. Supported report modes are as following:

- 0: Stop reporting.
- 1: TCP short-connection preferred mode. The connection is based on TCP protocol. The terminal connects to the backend server every time it needs to send data and will shut down the connection when the terminal finishes sending data. If it fails to establish TCP connection to the backend server (both Main Server and Backup Server), it will try to send data via SMS to the SMS gateway.
- 2: TCP short-connection forced mode. The connection is based on TCP protocol. The terminal connects to the backend server every time it needs to send data and will shut down the connection when the terminal finishes sending data. And if it fails to establish TCP connection to the backend server (both Main Server and Backup Server), it will store the data in the memory buffer if buffer report function is enabled, otherwise the data is dropped.
- 3: TCP long-connection mode. The connection is based on TCP protocol. The terminal connects to the backend server and maintains the connection by using the heartbeat data. The backend server should respond to the heartbeat data from the terminals.
- 4: UDP mode. The terminal will send data to the backend server by UDP protocol. Receiving protocol commands via UDP is supported if network allows it. It is recommended to enable heartbeat sending when UDP receiving is the case.
- 5: Force on SMS. Only use the SMS for transmitting.
- 6: UDP with fixed local port. Like the UDP mode, the terminal will send data using UDP protocol. The difference is the terminal will use fixed local port rather than random port to communicate with the server in this mode. Thus the backend server could use identical port to communicate with all terminals if the backend server and the terminals are all in the same VPN network. The port number the device uses is the same as the port number of the primary server.
- 7: TCP long-connection mode with the backup server. The connection is based on TCP protocol. The terminal connects to the backend server and maintains the connection by using the heartbeat data. The backend server should respond to the

heartbeat data from the terminals. If the main server is lost, it will try to connect the backup server. And if the backup server is also lost, it will try to connect the main server again.

- ✧ **<Buffer Mode>**: The working mode the buffer report function. When buffer report function is enabled, if the device goes into areas without network covering, it will store all reports locally. When the device goes back to areas with network covering, then it will send all the buffered reports through network.
 - 0: Disable the buffer report function.
 - 1: Low priority. The buffer report function is enabled and the device will send the buffered messages after sending the normal messages.
 - 2: High priority. The buffer report function is enabled and the device will send all the buffered messages before sending any normal message except the SOS message (+RESP:GTSOS).
- ✧ **<Main Server IP/Domain Name>**: The IP address or the domain name of the primary server.
- ✧ **<Main Server Port>**: The port of the primary server.
- ✧ **<Backup Server IP/Domain Name>**: The IP address or the domain name of the backup server.
- ✧ **<Backup Server Port>**: The port of the backup server.
- ✧ **<SMS Gateway>**: Maximum 20 characters (including the optional national code starting with "+"). Short code (for example: 10086) is also supported.
- ✧ **<Heartbeat Interval>**: the interval of sending heartbeat package message (+ACK:GTHBD) when report mode is TCP long-connection mode or UDP mode. If it is set to 0, there will be no heartbeat package message sending.
- ✧ **<SACK Enable>**: This defines whether the backend server should respond to the terminal with SACK messages when receiving messages from the terminal.
 - 0: The backend server does not reply SACK message after receiving message from the terminal.
 - 1: The backend server replies a SACK message when receiving a message from the terminal.
 - 2: The backend server replies a SACK message when receiving a message form the terminal, but the terminal does not check the serial number of the SACK message.
- ✧ **<Protocol Format>**: This defines the format of the message sent from the device to the backend server. 0 means using the ASCII format, and 1 means using the HEX format.
- ✧ **<SMS ACK Enable>**: This defines whether the ACK confirmation should be responded by SMS when the command was sent by SMS.
 - 0: The device will send the ACK confirmation according to the mode configured by the <Report Mode>.
 - 1: The device will send the ACK confirmation by SMS to the phone which sends the command by SMS.

The acknowledgment message of **AT+GTSRI** command:

➤ **+ACK:GTSRI,**

Example:

+ACK:GTSRI,DC0100,862170019025640,,0001,20140511093254,11F0\$

Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXFFFF, X ∈ {'A' – 'Z', '0' – '9'}	
Unique ID	15/12	IMEI/MUID	
Device Name	<=20	'0' – '9' 'a' – 'z' 'A' – 'Z' '-' '_'	
Serial Number	4	0000 – FFFF	
Send Time	14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

Note:

Only after both the command **AT+GTBSI** and **AT+GTSRI** are properly set can the ACK messages and other messages be sent to the backend server.

3.2.1.3. Quick Start Setting

The command **AT+GTQSS** is used to configure the parameters for network data connection and backend server information in one command if all these settings are within 160 bytes, otherwise use **AT+GTBSI** and **AT+GTSRI**.

➤ **AT+GTQSS=****Example:**

AT+GTQSS=gv600mg,,,,3,,1,116.226.44.17,7011,116.226.45.229,7012,+8613812341234,15,1,,0002\$

SN	Parameter	Length (Byte)	Range/Format	Default
1	Password	4 – 7	'0' – '9' 'a' – 'z' 'A' – 'Z'	gv600mg
2	LTE APN	<=40		
3	LTE APN User Name	<=30		
4	LTE APN User Password	<=30		
5	Report Mode	1	0 – 8	0
6	Reserved	0		
7	Buffer Mode	1	0 1 2	1
8	Main Server IP/ Domain Name	<=60		
9	Main Server Port	<=5	0 – 65535	
10	Backup Server IP/	<=60		

	Domain Name			
11	Backup Server Port	<=5	0 – 65535	
12	SMS Gateway	<=20		
13	Heartbeat Interval	<=3	0 5 – 360min	0
14	SACK Enable	1	0 1 2	0
15	Protocol Format	1	0 1	0
16	SMS ACK Enable	1	0 1	0
	Serial Number	4	0000 – FFFF	
	Tail Character	1	\$	\$

The acknowledgment message of **AT+GTQSS** command:

➤ **+ACK:GTQSS,**

Example: +ACK:GTQSS,DC0100,862170019025640,,0002,20140511093254,11F0\$			
Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXXFFF, X ∈ {'A' – 'Z', '0' – '9'}	
Unique ID	15/12	IMEI/MUID	
Device Name	<=20	'0' – '9' 'a' – 'z' 'A' – 'Z' '-' '_'	
Serial Number	4	0000 – FFFF	
Send Time	14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

3.2.2. Device Configuration

3.2.2.1. Global Configuration

The **AT+GTCFG** command is used to configure the global parameters.

➤ **AT+GTCFG=**

Example: AT+GTCFG=gv600mg,123456,gv600mg,,,,,,,,,,,,,,,,,,,,,0003\$ AT+GTCFG=gv600mg,,,1,123.4,0,,0,1,,2FF,0,1,1,300,0,1,1,,,0,0003\$				
SN	Parameter	Length (Byte)	Range/Format	Default
1	Password	4 – 7	'0' – '9' 'a' – 'z' 'A' – 'Z'	gv600mg

2	New Password	4 – 7	'0' – '9' 'a' – 'z' 'A' – 'Z'	
3	Device Name	<=20	'0' – '9' 'a' – 'z' 'A' – 'Z' '-' ' ' _	gv600mg
4	ODO Enable	1	0 1	0
5	ODO Initial Mileage	<=9	0.0 – 4294967.0Km	0.0
6	Reserved	0		
7	Reserved	0	0	0
8	Report Composition Mask	4	0000 – FFFF	003F
9	Power Saving Mode	1	0 – 3	1
10	Reserved	0		
11	Event Mask	4	0000 – FFFF	3DEF
12	IO Mode	1	0-F	0
13	LED On	1	0 1	0
14	Info Report Enable	1	0 1	0
15	Info Report Interval	<=5	30 – 86400sec	300
16	Location Request Mask	2	00 20	00
17	Reserved			
18	Backup Battery Charge Mode	1	0 1	0
19	AGPS Mode	1	0 1	0
20	GSM Report	4	0000 – FFFF	001F
21	GPS Lost Time	2	0 – 30min	0
22	GSM Deep Charge Mode	1	0 1	0
23	Reserved			
24	Reserved	0		
25	Reserved	0		
26	Reserved	0		
27	Wakeup Hour Interval	<=3	1-720(hour)	24
28	Sensor Wakeup Device Debounce	<=2	0 10-60(s)	10
29	Work Time per Wakeup	<=2	5-60(min)	15

30	Power Output	1	0 1	0
31	Temperature Sample Timer	<=3	0 10–255(s)	0
32	MUID Enable	1	0 1	0
	Serial Number	4	0000 – FFFF	
	Tail Character	1	\$	\$

- ✧ <New Password>: Change the current password with a new one.
- ✧ <Device Name>: An ASCII string to represent the name of the device.
- ✧ <ODO Enable>: Enable/Disable the odograph function to calculate the total mileage. The current mileage is included in every position message.
- ✧ <ODO Initial Mileage>: The initial value for calculating the total mileage.
- ✧ <Report Composition Mask>: Bitwise report mask to configure the composition of message, especially the GPS message composition.

- Bit 0 for <Speed>
- Bit 1 for <Azimuth>
- Bit 2 for <Altitude>
- Bit 3 for Network data, including <MCC>, <MNC>, <LAC>, <Cell ID> and the <reserved> parameter "00"
- Bit 4 for <Mileage>
- Bit 5 for <Send Time>
- Bit 6 for <Device Name>

For each bit, set it to 1 to enable corresponding component in the report and 0 to disable. This mask is effective to all messages.

- ✧ <Power Saving Mode>: Set the mode of power saving function. If the mode of power saving function is set to 0, the fixed report will follow <IGF Report Interval> when the engine is off. If the mode of power saving function is set to 1, the fixed report, geo-fence and speed alarm report functions are suspended when the device is static or the engine is off. If the mode of power saving function is set to 2, it is like mode 1 with the difference is that the fixed report will not be suspended and the fix and sending interval will be set to <IGF Report Interval> in **AT+GTFRI** when the engine is off.

- 0: Disable power saving function.
- 1: GPS deep saving mode.
- 2: GPS low saving mode.
- 3: GSM deep saving mode. When this mode is selected, the parameters "Wakeup Hour Interval", "Sensor Wakeup Device Debounce" and "Work Time per Wakeup" will be valid. 5 minutes in stillness status after ignition off, the device will enter power saving mode with both the modem and GPS module turned off. After that, the device will wake up periodically as "Wakeup Hour Interval" and "Work Time per Wakeup" determines how long the device will work upon each wake-up. For every wakeup, a **+RESP: GTFRI** (<Report ID> is 6: GSM deep mode fixed timing report/<Report Type> is 0: The normal fixed report) will be sent out. Triggers such as

device/vehicle movement, input and ignition can be used to wake up the device. The device will enter into sleep again once the triggers disappear.

✧ **<Event Mask>**: Bitwise mask to configure which event report should be sent to the backend server.

- Bit 0 for **+RESP:GTPNA**
- Bit 1 for **+RESP:GTPFA**
- Bit 2 for **+RESP:GTMPN**
- Bit 3 for **+RESP:GTMPF**
- Bit 4 is reserved
- Bit 5 for **+RESP:GTBPL**
- Bit 6 for **+RESP:GTBTC**
- Bit 7 for **+RESP:GTSTC**
- Bit 8 for **+RESP:GTSTT**
- Bit 9 for reserved
- Bit 10 for **+RESP:GTPDP**
- Bit 11 for **+RESP:GTPNL**
- Bit 12 for the ignition report **+RESP:GTIGN** and **+RESP:GTIGF**
- Bit 13 for location report **+RESP:GTIGL** when ignition on or ignition off
- Bit 14 for **+RESP:GTEXP**.

For each bit, set it to 1 to enable corresponding event report and 0 to disable.

✧ **<IO Mode>**: Configure the working mode of IO1-IO4 on the connector.

- Bit0: 0-Input1, 1-Output1
- Bit1: 0-Input2, 1-Output2
- Bit2: 0-Input3, 1-Output3
- Bit3: 0-Input4, 1-Output4

✧ **<LED On>**: Configure the working mode of power LED and GPS LED.

- 0: Each time the device powers on, both LEDs will work for 30 minutes and then are turned off deadly.
- 1: Turn on Power LED and GPS LED if necessary.

✧ **<Info Report Enable>**: Enable/Disable the device information report function (**+RESP:GTINF**).

The device information includes: state of the device, received signal strength, voltage of external power supply, battery voltage, charging status, Power and GPS LED working mode, the last known time of GPS fix, analog input voltage, all digit inputs and outputs status.

- 0: Disable the device information report function.
- 1: Enable the device information report function.

✧ **<Info Report Interval>**: The interval of reporting the device information.

✧ **<Location Request Mask>**: Bitwise mask for SMS request position. 4 high bits for SMS request and 4 low bits for reserved. Each bit, from bit 4 to bit 7, represents one kind of reports. Set to 1 to enable and 0 to disable corresponding report.

- Bit 5: Report the current position with Google Map link through SMS to the original number when the device receives SMS Request Position message via SMS.

✧ **<Backup Battery Charge Mode>**: Control the charge mode of the backup battery.

- 0: When the main power supply is connected, charge the backup battery on need.
- 1: When the main power supply is connected, the backup battery will be charged

only when ignition on is detected. The charge process will begin 3 minutes after the ignition on. The charge process is stopped after ignition off.

- ✧ <AGPS Mode>: A numeric to indicate the AGPS mode. AGPS is helpful to improve the chance to get GPS position successfully and reduce the time to get GPS position.

- 0: Disable the AGPS function.
- 1: AGPS Offline mode.

- ✧ <GSM Report>: It controls how or when to report cell information. The message **+RESP:GTGSM** is only sent via TCP short connection even if the report mode is Force on SMS.

The 2 high bits, Bit 14 – 15, represent the GSM report mode.

- 0: Do not allow the cell information report.
- 1: Allow the cell information report after failing to get GPS position if cell information is available.
- 2: Report the message **+RESP:GTGSM** after each successful GPS fix if cell information is available.
- 3: Report the message **+RESP:GTGSM** regardless of getting GPS position is successful or not if cell information is available.

Bitwise mask to configure which event report should be sent to the backend server.

- Bit 0 for **+RESP:GTRTL**
- Bit 1 for **+RESP:GTLBC**
- Bit 2 for **+RESP:GTFRI/+RESP:GTERI**
- Bit 3 for **+RESP:GTSOS**
- Bit 4 for **+RESP:GTTOW**
- Bit 5 – 13 are reserved

For each bit, set it to 1 to enable the corresponding event report, and 0 to disable the corresponding event report

- ✧ <GPS Lost Time>: A time parameter to monitor the GPS signal. If the device stays <GPS Lost Time> consecutively without GPS signal or without successful GPS fix, it will send the event report **+RESP: GTGSS** to indicate the GPS signal is lost. When the GPS signal is recovered or a successful fix is obtained again, the device will send the event report **+RESP:GTGSS** to indicate the recovery. 0 minute means to disable this function.

- ✧ <GSM Deep Charge Mode>:

- 0: When external power supply is connected or disconnected, the device will not be waked up. **+RESP:GTMPN** or **+RESP:GTMPF** will not be generated. Power LED will not flash.
- 1: When external power supply is connected, the device will be waked up. **+RESP:GTMPN** will be generated. Power LED will flash. When external power supply is disconnected, **+RESP:GTMPF** will be generated.

- ✧ <Wakeup Hour interval>: A numeral to specify the interval to wake up the terminal. The value 24 means the terminal wakes up once per 24 hours.
- ✧ <Sensor Wakeup Device Debounce>: A numeral to specify the debounce time for sensor for waking up the terminal in the GSM deep saving mode, 0 means no wakeup device.
- ✧ <Work Time per Wakeup>: Set work time per Wakeup, the value range 5 – 60 minutes and the default value is 15 minutes.

- ✧ <Power Output>: Set 5V(or 3.3V) output, enable or disable
- ✧ <Temperature Sample Timer>: Temperature sample interval. All sensors are read every time.
- ✧ <MUID Enable>: 1 means to use the MUID number instead of the IMEI number in the report. It is always 12 bytes. 0 means to disable this function.

The acknowledgment message of **AT+GTCFG** command:

➤ **+ACK:GTCFG,**

Example: +ACK:GTCFG,DC0100,862170019025640,,0003,20140511093254,11F0\$			
Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXFFFF, X ∈ {'A' – 'Z','0' – '9'}	
Unique ID	15/12	IMEI/MUID	
Device Name	<=20	'0' – '9' 'a' – 'z' 'A' – 'Z' '-' '_'	
Serial Number	4	0000 – FFFF	
Send Time	14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

3.2.2.2. Auto Unlock PIN

The **AT+GTPIN** command is used to unlock the USIM automatically.

➤ **AT+GTPIN=**

Example: AT+ GTPIN=gv600mg,1,1234,1,,,,,0011\$				
SN	Parameter	Length (Byte)	Range/Format	Default
1	Password	4 – 7	'0' – '9' 'a' – 'z' 'A' – 'Z'	gv600mg
2	Auto Unlock PIN	1	0 1	0
3	PIN	4-8	'0'-'9'	
4	Reserved			
5	Reserved			
6	Reserved			
7	Reserved			
8	Reserved			
	Serial Number	4	0000 – FFFF	

	Tail Character	1	\$	\$
--	----------------	---	----	----

- ✧ <Auto Unlock PIN>: A numeric to indicate whether to unlock the USIM-PIN for the device.
 - 0: Do not unlock USIM-PIN automatically.
 - 1: Each time the device powers on, it will detect whether the USIM card is locked with a PIN. If it is locked, the device will unlock the PIN automatically.
- ✧ <PIN>: The PIN code which is used to unlock the USIM automatically. If it is empty, the PIN code saved in the device will be cleared.

The acknowledgment message of **AT+ GTPIN** command:

➤ **+ACK: GTPIN,**

Example: +ACK: GTPIN,DC0100,862170019025640,,0011,20140511093254,11F0\$

Serial Number	4	0000 – FFFF	
Send Time	14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

3.2.2.3. Software Protocol Watchdog

The **AT+GTD0G** command is used to reboot the device or network module in a time based manner or upon ignition. This helps the device avoid working in an abnormal status for a long time. Besides these two automatic reboot methods, the device also supports using the digital input to trigger the reboot manually.

➤ **AT+GTD0G=**

Example: AT+GTD0G=gv600mg,1,,1,0130,,1,1,,60,,,0011\$ AT+GTD0G=gv600mg,2,30,,,,1,2,,60,,,0011\$ AT+GTD0G=gv600mg,0,60,25,,,1,0,1,60,60,60,0011\$				
SN	Parameter	Length (Byte)	Range/Format	Default
1	Password	4 – 7	'0' – '9' 'a' – 'z' 'A' – 'Z'	gv600mg
2	Mode	1	0 1 2	1
3	Ignition Frequency	<=3	10 – 120 min	60

4	Reboot Interval	<=2	1 – 30 day/hour	7
5	Reboot Time	4	HHMM	0200
6	Reserved	0		
7	Report Before Reboot	1	0 1	1
8	Input ID	1	0 1 2 3 4	0
9	Unit	1	0 1	0
10	No Network Interval	<=4	0 5-1440 min	480
11	No Activation interval	<=4	0 5-1440 min	480
12	Send Failure timeout	<=4	0 5-1440 min	480
	Serial Number	4	0000 – FFFF	
	Tail Character	1	\$	\$

- ✧ <Mode>: Working mode.
 - 0: Disable this function
 - 1: Reboot periodically according to the <Interval> and <Time> setting.
 - 2: Reboot when ignition on.
- ✧ <Ignition Frequency>: When the working mode is 2, if the time interval between this ignition and last ignition is greater than the specified value in Ignition Frequency, the device will automatically reboot upon ignition on. If the function is enabled for the first time, the device will reboot at next ignition even if the interval is less than the value set in Ignition Frequency.
- ✧ <Reboot Interval>: The interval to reboot the device per days or hours.
- ✧ <Reboot Time>: At what time to perform the reboot when <Interval> is met.
- ✧ <Report Before Reboot>: Whether to report the +RESP:GTDG message before reboot. 0 means not to report and 1 to report. If this parameter is enabled, the device will obtain a real-time location and send it to the server.
- ✧ <Input ID>: ID of the digital input port which is used to trigger the manual reboot. 0 means no manual reboot. Digital input ports 1 and 4 are supported.
- ✧ <Unit>: Unit
 - 0: Unit is day.
 - 1: Unit is hour.
- ✧ <No Network Interval>: The interval to reboot the device when in no network signal. 0 means no rebooting the device.
- ✧ <No Activation Interval>: The interval to reboot the device when PDP is unable to register or message interaction failed (such as no TCP Ack, Sever Ack). 0 means no rebooting the device.
- ✧ <Send Failure Timeout>: The device will reboot automatically if report sending time is greater than <Send Failure Timeout>. 0 minute means no rebooting the device.

The acknowledgment message of AT+GTDG command:

➤ **+ACK:GTD0G,**

Example: +ACK:GTD0G,DC0100,862170019025640,,0011,20140511093254,11F0\$			
Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXXFFF, X ∈ {'A' – 'Z', '0' – '9'}	
Unique ID	15/12	IMEI/MUID	
Device Name	<=20	'0' – '9' 'a' – 'z' 'A' – 'Z' '-' '_'	
Serial Number	4	0000 – FFFF	
Send Time	14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

3.2.2.4. Time Adjustment

The **AT+ GTTMA** command is used to adjust local time.

➤ **AT+ GTTMA =**

Example: AT+ GTTMA =gv600mg,-,3,30,0,20090917203500,,,,,0006\$				
SN	Parameter	Length (Byte)	Range/Format	Default
1	Password	4 – 7	'0' – '9' 'a' – 'z' 'A' – 'Z'	gv600mg
2	Sign	1	+ -	+
3	Hour Offset	<=2	0-12	00
4	Minute Offset	<=2	0-59	00
5	Daylight Saving	1	0 1	0
6	UTC Time	14	YYYYMMDDHHMMSS	
7	Reserved			
8	Reserved			
9	Reserved			
10	Reserved			
	Serial Number	4	0000 – FFFF	
	Tail Character	1	\$	\$

- ✧ <Sign>: Indicate the positive or negative of the local time offset to UTC
- ✧ <Hour Offset>: UTC offset in hours
- ✧ <Minute Offset>: UTC offset in minutes
- ✧ <Daylight Saving>: Enable/disable daylight saving time.
 - 0: Disable daylight saving
 - 1: Enable daylight saving
- ✧ <UTC time>: The UTC time.

The acknowledgment message of **AT+ GTTMA** command:

➤ **+ACK: GTTMA.**

Example:			
+ACK: GTTMA,DC0100,862170019025640,,0011,20140511093254,11F0\$			
Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXFFFF, X ∈ {'A' – 'Z', '0' – '9'}	
Unique ID	15/12	IMEI/MUID	
Device Name	<=20	'0' – '9' 'a' – 'z' 'A' – 'Z' ' ' ' _ '	
Serial Number	4	0000 – FFFF	
Send Time	14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

3.2.2.5. Outside Working Hours

To protect the privacy of the drivers when they are off duty, the device could be configured to report empty location information during the outside working hours. The command **AT+GTOWH** is used to define the working hours and the working mode. When this function is enabled, the device will send empty latitude, empty longitude, empty LAC and empty Cell ID in all the messages except **+RESP:GTSOS**.

➤ **AT+GTOWH=**

Example: AT+GTOWH=gv600mg,1,1F,0900,1200,1300,1730,,,3,1,1,0,,,,,0010\$				
SN	Parameter	Length (Byte)	Range/Format	Default
1	Password	4 – 7	'0' – '9' 'a' – 'z' 'A' – 'Z'	gv600mg
2	Mode	1	0 1 2 3	0
3	Day of Work	<=2	0 – 7F	1F
4	Working Hours Start1	4	HHMM	0900

5	Working Hours End1	4	HHMM	1200
6	Working Hours Start2	4	HHMM	1300
7	Working Hours End2	4	HHMM	1800
8	Reserved	0		
9	Reserved	0		
10	Digital Input ID	1	0 – 4	0
11	Output ID	1	0 – 4	0
12	Output Status	1	0 1	
13	Duration	<=3	0 – 255(×100ms)	0
14	Toggle Times	<=3	0 – 255	0
15	Reserved	0		
16	Reserved	0		
17	Reserved	0		
18	Reserved	0		
	Serial Number	4	0000 – FFFF	
	Tail Character	1	\$	\$

✧ <Mode>: Working Mode.

- 0: Disable this function.
- 1: Manual Mode. In this mode, location information will be hidden under two conditions: the device works at outside the working hours and digital input is triggered.
- 2: Full Manual Mode. In this mode, location information will be hidden under the following condition: the digital input is triggered.
- 3: Automatic Mode. In this mode, location information will be hidden under the following condition: the device works at outside the working hours.

✧ <Day of Work>: Specify the working days in a week in a bitwise manner.

- Bit 0 for Monday
- Bit 1 for Tuesday
- Bit 2 for Wednesday
- Bit 3 for Thursday
- Bit 4 for Friday
- Bit 5 for Saturday
- Bit 6 for Sunday

For each bit, 0 means off duty day and 1 means working day.

✧ <Working Hours Start1>, <Working Hours End1>: The first period of the working hours in a day.

✧ <Working Hours Start2>, <Working Hours End2>: The second period of the working hours in

a day.

- ✧ **<Digital Input ID>**: The input ID used to trigger this function when mode is 1 or 2. The working parameters of the specified input must be set by **AT+GTDIS** first. If using interruptible digital input, please connect slide button instead of tact button to that input.
- ✧ **<Output ID>, <Output Status>, <Duration> and <Toggle Times>**: When this function is enabled and it is off duty time, the specified waveform will be output to the specified output.

The acknowledgment message of **AT+GTOWH** command:

➤ **+ACK:GTOWH,**

Example: +ACK:GTOWH,DC0100,862170019025640,,0010,20140511093254,11F0\$			
Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXXFFF, X ∈ {'A' – 'Z', '0' – '9'}	
Unique ID	15/12	IMEI/MUID	
Device Name	<=20	'0' – '9' 'a' – 'z' 'A' – 'Z' '-' '_'	
Serial Number	4	0000 – FFFF	
Send Time	14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

3.2.2.6. Preserve Device Special Logical State

The command **AT+GTPDS** is used to preserve special device logical state for the terminal. According to the working mode, the function is enabled or disabled. According to the value of the MASK, specified logical state(s) will be saved.

➤ **AT+GTPDS=**

Example: AT+GTPDS=gv600mg,1,0,,,,,,001A\$				
SN	Parameter	Length (Byte)	Range/Format	Default
1	Password	4 – 7	'0' – '9' 'a' – 'z' 'A' – 'Z'	gv600mg
2	Mode	1	0 1 2	1
3	Mask	4	0000-07FF	7FF
4	Reserved			
5	Reserved			

- ✧ **<Mode>:**
 - 0: Disable this function
 - 1: Preserve special device logical state according to the value of the MASK
 - 2: Reset all the special logical states of the device that listed in the **<Mask>** after receiving the command, and then preserve the special logical state of the device according to the value of the **<Mask>**.
- ✧ **<Mask>:** Bitwise mask to configure which device states will be preserved. Each bit represents a state.
 - Bit 0: States of GEO
 - Bit 1: Reserved bit
 - Bit 2: Reserved bit
 - Bit 3: Information of last known position
 - Bit 4: State of ignition
 - Bit 5: State of waveform 1
 - Bit 6: State of digital input
 - Bit 7: State of SPD
 - Bit 8: Reserved bit
 - Bit 9: State of main power
 - Bit 10: State of PEO

➤ **+ACK:GTPDS,**

QSZTRACGV600MGAN0103

Tail Character	1	\$	\$
----------------	---	----	----

3.2.2.7. Configuration File Version

The command **AT+GTFVR** is used to record information of the configuration file version.

➤ **AT+GTFVR=**

Example:				
AT+GTFVR=gv600mg,,0000,,,,,,,,,0010\$				
SN	Parameter	Length (Byte)	Range/Format	Default
1	Password	4 – 20	'0' – '9' 'a' – 'z' 'A' – 'Z'	gv600mg
2	Reserved	0		
3	Configuration Version	4	0000 – FFFF	
4	Reserved	0		
5	Reserved	0		
6	Reserved	0		
7	Reserved	0		
8	Reserved	0		
9	Reserved	0		
10	Reserved	0		
11	Reserved	0		
12	Reserved	0		
13	Reserved	0		
	Serial Number	4	0000 – FFFF	
	Tail Character	1	\$	\$

✧ **<Password>**: The valid characters for the password include '0'-'9', 'a' – 'z', and 'A'-'Z'. The default value is "gv600mg".

✧ **<Configuration Version>**: The version number of the configuration. The first two characters means the major version number, the last two characters means the minor version number.

The acknowledgment message of **AT+GTFVR** command:

➤ **+ACK:GTFVR,**

Example:			
+ACK:GTFVR,DC0100,135790246811220,,0012,20090214093254,11F0\$			
Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXXFFF, X ∈ {'A' – 'Z', '0' – '9'}	
Unique ID	15 14	IMEI MEID	
Device Name	<=20	'0'-'9' 'a'-'z' 'A'-'Z' '-' '_'	
Serial Number	4	0000 – FFFF	
Send Time	14	YYYYMMDDHHMMSS	

Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

3.2.3. Position Related Report

3.2.3.1. Fixed Report Information

The command **AT+GTFRI** is used to configure the parameters of scheduled report (**+RESP:GTFRI** or **+RESP:GTERI**).

➤ AT+GTFRI=

Example:

AT+GTFRI=gv600mg,0,,,,,,,,,,,,,0009\$

AT+GTFRI=gv600mg,1,1,,1,1000,2300,,30,,,,,600,,,,,0009\$

AT+GTFRI=gv600mg,2,1,,1,1000,2300,,,500,,,,,,,,,0009\$

AT+GTFRI=gv600mg,3,1,,1,1000,2300,,,,1000,,,,,,,,,0009\$

AT+GTFRI=gv600mg,4,1,,1,1000,2300,,60,,300,,,,,,,,,0009\$

SN	Parameter	Length (Byte)	Range/Format	Default
1	Password	4 – 7	'0' – '9' 'a' – 'z' 'A' – 'Z'	gv600mg
2	Mode	1	0 – 5	0
3	Discard No Fix	<=2	0 1	1
4	Reserved	0		
5	Period Enable	1	0 1	1
6	Start Time	4	HHMM	0000
7	End Time	4	HHMM	0000
8	Reserved	0		
9	Send Interval	<=5	5 – 86400sec	30
10	Distance	<=5	50 – 65535m	1000
11	Mileage	<=5	50 – 65535m	1000
12	Reserved	0		
13	Corner Report	<=3	0 – 180	0
14	IGF Report Interval	<=5	0 5-86400sec	600
15	ERI Mask	8	00000000-FFFFFFFF	00000000
16	FRI enable for GSM DEEP	1	0 1	0

17	Reserved	0		
18	Reserved	0		
	Serial Number	4	0000 – FFFF	
	Tail Character	1	\$	\$

✧ <Mode>: The working mode of the fixed report.

- 0: Disable this function.
- 1: Fixed Timing Report. The position message is sent to the backend server periodically according to the parameter <Send Interval>.
- 2: Fixed Distance Report. The position message is sent to the backend server when the straight-line distance between the current GPS position and the last sent GPS position is greater than or equal to the distance specified by parameter <Distance>.
- 3: Fixed Mileage Report. The position message is sent to the backend server when the path length between the current GPS position and the last sent GPS position is greater than or equal to the mileage specified by parameter <Mileage>. It requires connecting the vehicle ignition signal to the specified digital input port of the device to use this function.
- 4: Optimum Report. Optimum Report mode combines the Fixed Timing Report and Fixed Mileage Report. Only when the report time interval is greater than or equal to the <Send Interval> and the cumulative mileage is greater than or equal to the <Mileage> will the Optimum Report be sent to the server. It requires connecting the vehicle ignition wire to the specified digital input port of the device to use this function.
- 5: Fixed Time or Mileage Report. Fixed Time or Mileage Report mode combines the Fixed Timing Report and Fixed Mileage Report. The device will detect <Send Interval> and the <Mileage> at the same time. As long as one of them meets the conditions, the report will be sent to the server. It requires connecting the vehicle ignition wire to the specified digital input port of the device to use this function.

Note: If the engine is off, the positional message is sent to the backend server periodically according to the parameter <IGF Report Interval>.

✧ <Discard No Fix>: Disable/Enable reporting when there is no GPS fixing

- 0: Enable reporting
- 1: Disable reporting

✧ <Period Enable>: Disable/enable the time range specified by <Start time> and <End time>. If the time range is enabled, the position reporting is limited within the time range.

✧ <Start Time>: The start time of the scheduled fixed report. The valid format is "HHMM". The value range of "HH" is "00"–"23". The value range of "MM" is "00"–"59".

✧ <End Time>: The end time of the scheduled fixed report. The valid format and range are as same as <Start Time>.

✧ <Send Interval>: Period to send the position information. The value range is 5 – 86400 and the unit is second. If <Report Mode> in **AT+GTSRI** is set to Force on SMS, <Send Interval> should be greater than 15 seconds, otherwise the reports will be sent via TCP short

connection.

- ✧ **<Distance>**: The specified distance to send the position information when **<Mode>** is 2. Unit: meter.
- ✧ **<Mileage>**: The specified length to send the position information when **<Mode>** is 3 and 4. Unit: meter.
- ✧ **<Corner Report>**: The threshold to determine whether the device is turning around a corner. 0 is to disable the corner report. For other values, the device will compare the current azimuth with the last known one, if the difference is greater than or equal to this value, the corner report is sent with **+RESP:GTFRI**.
- ✧ **<IGF Report Interval>**: Period to fix and send the position information when **<Power Saving Mode>** in **AT+GTCFG** is set to 2, the engine is off and **<Mode>** is set to 1 (Fixed Timing Report). Its value range is 0|5 – 86400 and the unit is second.
- ✧ **<ERI Mask>**: If the serial port is connected to peripherals and the mask is not 0x00000000, the device will send **+RESP:GTERI** instead of **+RESP:GTFRI**. This mask is used to configure whether to report the data from peripherals by **+RESP:GTERI**.
 - Bit 0 for reserved.
 - Bit 1 for temperature sensor.
 - Bit 2 for reserved.
 - Bit 3 for **<Percentage>** field in the report of **+RESP:GTERI**. If it is set to 1, the data block **<Fuel Sensor Data>** will be displayed.
 - Bit 4 for **<Volume>** field in the report of **+RESP:GTERI**. If it is set to 1, the data block **<Fuel Sensor Data>** will be displayed.
 - Bit 8 for **<Bluetooth accessory>** field in the report of **+RESP:GTERI**. If it is set to 1, the data block **<Bluetooth accessory>** will be displayed.
- ✧ **<FRI enable for GSM DEEP>**: This field is valid only for GSM deep mode. After device is waken up, if device is under ignition off state, FRI report will be sent regularly at the interval of "IGF Report Interval", and tow function will be disabled at this time.

The acknowledgment message of **AT+GTFRI** command:

➤ **+ACK:GTFRI,**

Example:			
+ACK:GTFRI,DC0100,862170019025640,,0009,20140511093254,11F0\$			
Parameter	Length (Byte)	Range/Format	Default

Tail Character	1	\$	\$
----------------	---	----	----

3.2.3.2. Frequency Change of Fixed Report Configuration

The command **AT+GTFFC** is used to change the parameters of fixed report when certain event occurs. When the event disappears, the device will restore to its previous settings.

The device supports up to 5 sets of parameter for different events. Priority is assigned among these events. Only the set of parameters with the highest priority event will be executed if more than one event occurs at the same time.

➤ AT+GTFFC=

Example: AT+GTFFC=gv600mg,0,1,0,30,500,500,300,,,,,0016\$				
SN	Parameter	Length (Byte)	Range/Format	Default
1	Password	4 – 7	'0' – '9' 'a' – 'z' 'A' – 'Z'	gv600mg
2	Priority	1	0-4	0
3	Mode	1	0-3	0
4	FRI Mode	1	0-5	0
5	FRI IGN Report Interval	<=5	5-86400s	30
6	FRI Report Distance	<=5	50-65535m	500

✧ <Priority>: Priority of the event which triggers the parameter change for fixed report. 0 has the highest priority.

✧ <Mode>: Specify the trigger event to change the fixed report parameters.

- 0: Disable the parameters in the specified priority.
- 1: Change the fixed report parameter when the device enters into any of the defined Geo-Fence.
- 2: Change the fixed report parameter when the device enters into known roaming

state.

- 3: Change the fixed report parameter when the device enters into unknown roaming state.

- ✧ <FRI Mode>: When the specified event occurs, the working mode of the fixed report will be changed according to this parameter.
 - 0: Do not change the working mode
 - 1: Change the working mode to 'Timing Report'.
 - 2: Change the working mode to 'Distance Report'.
 - 3: Change the working mode to 'Mileage Report'.
 - 4: Change the working mode to 'Optimum Report'.
 - 5: Change the working mode to 'Fixed Time or Mileage Report'.
- ✧ <FRI IGN Report Interval>: Period to send the position information when ignition is on. The value range is 5 – 86400 and the unit is second.
- ✧ <FRI Report Distance>: The specified distance to send the position information when it is changed to fixed distance report. Unit: meter.
- ✧ <FRI Report Mileage>: The specified path length to send the position information when it is changed to fixed mileage report or optimum report. Unit: meter.
- ✧ <FRI IGF Report Interval>: Period to fix and send the position information when ignition is off if <Power Saving Mode> in **AT+GTCFG** is set to 2 and <FRI Mode> in this command is set to 1 (Fixed Timing Report). The value range is 0|5 – 86400 and the unit is second.
- ✧ <Corner Report>: The threshold to determine whether the device is turning around a corner. 0 means "Disable the corner report". For other values, the device will compare the current azimuth with the last known one, if the difference is greater than or equal to this value, the device will send the corner report with **+RESP:GTFRI**.

The acknowledgment message of **AT+GTFFC** command:

3.2.4. Alarm Settings

3.2.4.1. Geo-Fence Configuration

The command **AT+GTGEO** is used to configure the parameters of Circular Geo-Fence. (Geo-Fence is a virtual perimeter on a geographic area. When the terminal enters or exits the area, a notification will be generated. The notification contains information about the location of the terminal and can be sent to the backend server.)

➤ AT+GTGEO=

Example: AT+GTGEO=gv600mg,0,3,121.412248,31.187891,1000,600,1,1,0,0,0,0,,,000A\$				
SN	Parameter	Length (Byte)	Range/Format	Default
1	Password	4 – 7	'0' – '9' 'a' – 'z' 'A' – 'Z'	gv600mg
2	GEO ID	<=2	0 – 19	
3	Mode	1	0 – 3	0
4	Longitude	<=11	(-)xxx.xxxxxx	
5	Latitude	<=10	(-)xx.xxxxxx	
6	Radius	<=7	50 – 6000000m	50
7	Check Interval	<=5	0 5 – 86400sec	0
8	Output ID	1	0 – 4	0
9	Output Status	1	0 1	
10	Duration	<=3	0 – 255(×100ms)	0
11	Toggle Times	<=3	0 – 255	0
12	Trigger Mode	<=2	0 21 22	0
13	Trigger Report	1	0 1	0
14	Reserved	0		
15	Reserved	0		
	Serial Number	4	0000 – FFFF	
	Tail Character	1	\$	\$

- ✧ <GEO ID>: ID of the circular Geo-Fence. Total 20 zones, 0 to 19, are supported.
- ✧ <Mode>: The working mode of the circular Geo-Fence to send the message **+RESP:GTGIN** or **+RESP:GTGOT** to the backend server.
 - 0: Disable the zone's Geo-Fence function.
 - 1: Entering the zone. The report will be generated only when the terminal enters the

Geo-Fence.

- 2: Exiting the zone. The report will be generated only when the terminal exits from the Geo-Fence.
 - 3: Both entering and exiting.
- ✧ <Longitude>: The longitude of a point which is defined as the center of the Circular Geo-Fence region. The format is “(-) xxx.xxxxx” and the value range is from “-180.000000” to “180.000000”. The unit is degree. West longitude is defined as negative value starting with “-” and east longitude is defined as positive value without “+”.
- ✧ <Latitude>: The latitude of a point which is defined as the centre of the circular Geo-Fence region. The format is “(-) xx.xxxxx” and the value range is from “-90.000000” to “90.000000”. The unit is degree. South Latitude is defined as negative value starting with “-” and north Latitude is defined as positive value without “+”.
- ✧ <Radius>: The radius of the circular Geo-Fence region. The value range is 50 – 6000000 and the unit is meter.
- ✧ <Check Interval>: The interval of GPS checking for the circular Geo-Fence alarm.
- ✧ <Trigger Mode>:
- 0: Disable auto trigger mode
 - 21: Automatically set circular Geo Fence after ignition off. In this mode, the device will automatically set a circular Geo-Fence with the current location as the center point of the Geo-Fence when ignition is off. This circular Geo-Fence will only report exiting alarm. The circular Geo-Fence will be cancelled after exiting
 - 22: Manually enable circular Geo-Fence after ignition off. In this mode, the device will automatically set a circular Geo-Fence with the current location as the center point of the Geo-Fence when ignition is off. This circular Geo-Fence will only report exiting alarm. When the device exits this circular Geo-Fence, it will cancel this circular Geo-Fence and disable the trigger mode at the same time. The driver has to manually set it again if he/she wants to use this trigger mode next time.
- ✧ <Trigger Report>: Whether to send **+RESP:GTGES** message when specified trigger mode is triggered and when the Geo-Fence is cancelled.
- 0: Disable report **+RESP: GTGES**.
 - 1: Enable report **+RESP: GTGES**.

Send Time	14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

3.2.4.4. Speed Alarm

This command is used to set speed-alarm range for the terminal. According to the working mode,

the terminal will send message **+RESP:GTSPD** to the backend server when its moving speed is outside or inside the range.

➤ **AT+GTSPD=**

Example: AT+GTSPD=gv600mg,1,80,120,60,300,1,1,0,0,,,,,,,,,000C\$				
SN	Parameter	Length (Byte)	Range/Format	Default
1	Password	4 – 7	'0' – '9' 'a' – 'z' 'A' – 'Z'	gv600mg
2	Mode	1	0 1 2 3 4	0
3	Min Speed	<=3	0 – 400km/h	0
4	Max Speed	<=3	0 – 400km/h	0
5	Valid Time	<=4	0 – 3600sec	60
6	Send Interval	<=4	30 – 3600sec	300
7	Output ID	1	0 – 4	0
8	Output Status	1	0 1	
9	Duration	<=3	0 – 255(×100ms)	0
10	Toggle Times	<=3	0 – 255	0
11	Reserved	0		
12	Reserved	0		
13	Reserved	0		
14	Reserved	0		
15	Reserved	0		
16	Reserved	0		
17	Reserved	0		
18	Reserved	0		
19	Reserved	0		
20	Reserved	0		
21	Reserved	0		
	Serial Number	4	0000 – FFFF	
	Tail Character	1	\$	\$

✧ **<Mode>**: The working mode of the speed alarm.

- 0: Disable speed alarm.

- 1: Report speed alarm if the current speed is within the speed range defined by *<Min Speed>* and *<Max Speed>*.
 - 2: Report speed alarm if the current speed is outside the speed range defined by *<Min Speed>* and *<Max Speed>*.
 - 3: Report speed alarm only once if the current speed is within or outside the speed range defined by *<Min Speed>* and *<Max Speed>*. In this mode, *<Send Interval>* will be ignored.
 - 4: Report speed alarm when the speed changes from inside to outside or vice versa. But the backend server cannot receive **+RESP:GTSPD** for speed changes from inside to outside unless **+RESP:GTSPD** for speed changes from outside to inside is received first. In this mode, *<Send Interval>* will be ignored.
- ✧ *<Min Speed>*: The lower limit speed.
- ✧ *<Max Speed>*: The upper limit speed.
- ✧ *<Valid Time>*: If the speed meets the alarm condition and maintains the period of time defined by *<Valid Time>*, the speed alarm will be triggered.
- ✧ *<Send Interval>*: The time interval of sending speed alarm message.

The acknowledgment message of **AT+GTSPD** command:

➤ **+ACK:GTSPD,**

Example: +ACK:GTSPD,DC0100,862170019025640,,000C,20140511093254,11F0\$			
Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXFFFF, X ∈ {'A' – 'Z', '0' – '9'}	
Unique ID	15/12	IMEI/MUID

26	Reserved	0		
27	Reserved	0		
28	Reserved	0		
29	Reserved	0		
30	Output ID	1	0 – 4	0
31	Output Status	1	0 1	
32	Duration	<=3	0~255(×100ms)	0
33	Toggle Times	<=3	0 – 255	0
34	Reserved	0		
35	Reserved	0		
	Serial Number	4	0000 – FFFF	
	Tail Character	1	\$	\$

- ✧ <Mode>: Working mode of the roaming detection function.
 - 0: Disable this function.
 - 1: Enable this function.
- ✧ <Operator Start>: A numeral which indicates the first index of the white operator numbers to be input. For example, if the value is 1, it will update the white operator list from the 1st one. If the parameter is empty, there should be no white number list following the empty value.
- ✧ <Operator End>: A numeral which indicates the last index of the white operator numbers to be input. For example, if the value is 2, it will update the white operator list until the 2nd one. If the parameter is empty, there should be no white number list following the empty value.
- ✧ <Home Operator List>: A white number list of PLMN operators. The numbers are comprised of MCC and MNC, both of which consist of 3 digits. The operators in this list will be considered as in “Home” state. And two adjacent operator numbers are separated with ‘,’. The number of the operators in the list depends on the parameters <Operator Start> and <Operator End>. For example, if <Operator Start> is 1 and <Operator End> is 2, the operator

list should include 2 operator numbers (empty value acceptable) and the two numbers are separated by with ','. 'MCCFF' type code is used to identify operators across a whole country. For example, '460FF' covers the mobile network operators all across China.

- ✧ <Roaming Operator List>: It is like the <Home Operator List> with difference that the operators in this list will be considered as in "Known Roaming" state.
- ✧ <Black Operator List>: It is like the <Home Operator List> with the difference that the operators in this list will be considered as in "Blocking Report" state. In this state, all reports will be buffered instead of being sent.

Operators that are not in <Home Operator List>, <Roaming Operator List> and <Black Operator List> will be considered as in "Unknown Roaming" state.

- ✧ <Known Roaming Event Mask>: Bitwise mask to configure which event report should be sent to the backend server when GSM roaming state is detected. If the roaming state is "Known Roaming", the <Known Roaming Event Mask> will be valid; otherwise the <Unknown Roaming Event Mask> will be valid.

- Bit 0 for +RESP:GTPNA
- Bit 1 for +RESP:GTPFA
- Bit 2 for +RESP:GTMPN
- Bit 3 for +RESP:GTMPF
- Bit 4 is reserved
- Bit 5 for +RESP:GTBPL
- Bit 6 for +RESP:GTBTC
- Bit 7 for +RESP:GTSTC
- Bit 8 for +RESP:GTSTT
- Bit 9 is reserved
- Bit 10 for +RESP:GTPDP
- Bit 11 for +RESP:GTPNL
- Bit 12 for the ignition report +RESP:GTIGN/GTVGN and +RESP:GTIGF/GTVGF
- Bit 13 for the ignition on location report +RESP:GTIGL
- Bit 14 for +RESP:GTEXP
- Reserved
- Others are Reserved

For each bit, set it to 1 to enable corresponding event report, and 0 to disable.

- ✧ <Unknown Roaming Event Mask>: It works as the <Known Roaming Event Mask>.
- ✧ <Output ID>, <Output Status>, <Duration> and <Toggle Times>: When this function is enabled and roaming state is detected, the specified wave will be sent to the specified output.

The acknowledgment message of the **AT+GTRMD** command:

➤ **+ACK:GTRMD,**

Example:			
+ACK:GTRMD,DC0100,135790246811220,,0000,20090214093254,11F0\$			
Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXXFFF, X ∈ {'A' –	

		'Z', '0' – '9'}	
Unique ID	15/12	IMEI/MUID	
Device Name	<=20	'0' – '9' 'a' – 'z' 'A' – 'Z'	
Serial Number	4	0000 – FFFF	
Send Time	14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

Note:

The length of AT Command cannot exceed 180 bytes when it is sent via Manage Tool. Make sure the command length is not more than 180 bytes through proper <Start Index> and <End Index> settings. A yellow prompt will appear on the Command Text Box if the length is over 180 bytes.

3.2.4.7. Buzzer Alarm

This command is used to set the buzzer alarm. There are four kinds of alarms. Each kind outputs a different sound. Before using those alarms, configure the output ID connected to the buzzer and enable it. The following event, over speed, can trigger the buzzer alarm defined by this command. Please refer to command **AT+GTSPA** for details.

➤ **AT+GTBZA=****Example:**

AT+GTBZA=gv600mg,2,,,,1,2,10,,,0,6,10,,,0,10,10,,,0,20,10,,,,,,,,,0000\$

SN	Parameter	Length (Byte)	Range/Format	Default
1	Password	4 – 20	'0' – '9' 'a' – 'z' 'A' – 'Z'	gv600mg
2	Output ID	1	0-4	0
3	Reserved	0		
4	Reserved	0		
5	Reserved	0		
6	Alarm 1 Output Status	1	0 1	
7	Duration	<=3	0 – 255 (×100ms)	0
8	Toggle Times	<=3	0 – 255	0
9	Reserved	0		
10	Reserved	0		
11	Alarm 2 Output Status	1	0 1	

12	Duration	<=3	0 – 255 (×100ms)	0
13	Toggle Times	<=3	0 – 255	0
14	Reserved	0		
15	Reserved	0		
16	Alarm 3 Output Status	1	0 1	
17	Duration	<=3	0 – 255 (×100ms)	0
18	Toggle Times	<=3	0 – 255	0
19	Reserved	0		
20	Reserved	0		
21	Alarm 4 Output Status	1	0 1	
22	Duration	<=3	0 – 255 (×100ms)	0
23	Toggle Times	<=3	0 – 255	0
24	Reserved	0		
25	Reserved	0		
26	Reserved	0		
27	Reserved	0		
28	Reserved	0		
29	Reserved	0		
30	Reserved	0		
31	Reserved	0		
	Serial Number	4	0000 – FFFF	
	Tail Character	1	\$	\$

✧ <Output ID>: The output port which connects to the buzzer.

The acknowledgment message of the **AT+GTBZA** command:

➤ **+ACK:GTBZA,**

Example: +ACK:GTBZA,DC0100,862170019025640,,000D,20090214093254,FFFF\$			
Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXXFFF, X∈{'A' – 'Z', '0' – '9'}	
Unique ID	15/12	IMEI/MUID	

Device Name	<=20	'0' – '9' 'a' – 'z' 'A' – 'Z' '-' '_'	
Serial Number	4	0000 – FFFF	
Send Time	14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

3.2.4.8. Overspeed Alarm

This command is used to set the speed thresholds and bind one alarm type with each speed threshold for the buzzer alarm. If the current speed meets one of the thresholds, the buzzer will make a sound corresponding to the alarm type.

➤ AT+GTSPA

Example:

AT+GTSPA= gv600mg,2,,,,1,2,10,,,0,6,10,,,0,10,10,,,0,20,10,,,,,,0000\$

SN	Parameter	Length (Byte)	Range/Format	Default
1	Password	4 – 20	'0' – '9' 'a' – 'z' 'A' – 'Z'	gv600mg
2	Mode	1	0 1 2	0
3	Speed Threshold 1	<=3	0 – 400km/h	50
4	Reserved	0		
5	Validity	<=4	0 – 3600sec	60
6	Alarm Type	1	0 1 – 4	0
7	Reserved	0		
8	Reserved	0		
9	Speed Threshold 2	<=3	0 – 400km/h	70
10	Reserved	0		
11	Validity	<=4	0 – 3600sec	60
12	Alarm Type	1	0 1 – 4	0
13	Reserved	0		
14	Reserved	0		
15	Speed Threshold 3	<=3	0 – 400km/h	90
16	Reserved	0		
17	Validity	<=4	0 – 3600sec	60

18	Alarm Type	1	0 1 – 4	0
19	Reserved	0		
20	Reserved	0		
21	Speed Threshold 4	<=3	0 – 400km/h	110
22	Reserved	0		
23	Validity	<=4	0 – 3600sec	60
24	Alarm Type	1	0 1 – 4	0
25	Reserved	0		
26	Reserved	0		
27	Reserved	0		
28	Reserved	0		
29	Reserved	0		
30	Reserved	0		
31	Reserved	0		
32	Reserved	0		
	Serial Number	4	0000 – FFFF	
	Tail Character	1	\$	\$

- ✧ <Mode>: The working mode of overspeed alarm.
 - 0: Disable this function.
 - 1: Strict Standard Mode. This mode will check the speed and trigger the buzzer alarm during speedup or slowdown.
 - 2: Warning Mode. This mode will only check the speed and trigger the buzzer alarm during speedup.
- ✧ <Speed Threshold>: The minimum speed to trigger the buzzer alarm.
- ✧ <Validity>: If the speed meets the alarm condition and is maintained for the period of time longer than <Validity>, the buzzer alarm will be triggered.
- ✧ <Alarm Type>: The alarm type for each speed threshold. 0 means “No buzzer alarm”.

The acknowledgment message of the **AT+GTSPA** command:

➤ **+ACK:GTSPA,**

Example: +ACK:GTSPA,DC0100,862170019025640,,000D,20090214093254,FFFF\$			
Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXXFFF, X ∈ {'A' – 'Z', '0' – '9'}	

Unique ID	15/12	IMEI/MUID	
Device Name	<=20	'0' – '9' 'a' – 'z' 'A' – 'Z' '-' '_'	
Serial Number	4	0000 – FFFF	
Send Time	14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

3.2.4.9. Excessive Idling Detection

The command **AT+GTIDL** is used to detect excessive engine idling (stationary while ignition on). The ignition signal must be connected to the device to use this function. When the device detects that the vehicle is entering into idle status, it will send event message **+RESP:GTIDN** to the backend server. When the vehicle exits the idle status, the device will send event message **+RESP:GTIDF** to the backend server.

➤ AT+GTIDL=

Example: AT+GTIDL=gv600mg,1,2,1,,,,,1,1,0,0,,,,,000E\$				
SN	Parameter	Length (Byte)	Range/Format	Default
1	Password	4 – 7	'0' – '9' 'a' – 'z' 'A' – 'Z'	gv600mg
2	Mode	1	0 1	0
3	Idling Detection Time	2	1 – 30 min	2
4	Idling End Time	1	1 – 5 min	1
5	Reserved	0		
6	Reserved	0		
7	Reserved	0		
8	Reserved	0		
9	Output ID	1	0 – 4	0
10	Output Status	1	0 1	0
11	Duration	<=3	0 – 255(×100ms)	0
12	Toggle Times	<=3	0 – 255	0
13	Debounce Option	1	0-1	0
14	Reserved	0		
15	Reserved	0		

16	Reserved	0		
	Serial Number	4	0000 – FFFF	
	Tail Character	1	\$	\$

- ✧ **<Mode>**: Working mode.
 - 0: Disable this function
 - 1: Enable this function.
- ✧ **<Idling Detection Time>**: If the vehicle is detected to be stationary with ignition on for this time long, it is considered to be in idling status.
- ✧ **<Idling End Time>**: After the vehicle enters into idling status, if it moves again or turns ignition off and keeps in that status for this time long, the vehicle is considered to exit idling status.
- ✧ **<Output ID>**: Specify the ID of the output port (1 to 4) to output specified waveform when the vehicle enters into idling status. If it is set to 0, there is no output waveform.
- ✧ **<Debounce Option>**: Specify required debouncing time to exit idle state after ignition off. 0 means needing no debouncing. 1 means needing to debounce **<Time to Movement>**.

The acknowledgment message of **AT+GTIDL** command:

➤ **+ACK:GTIDL**,

Example: +ACK:GTIDL,DC0100,862170019025640,,000E,20140511093254,11F0\$			
Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXFFFF, X ∈ {'A' – 'Z','0' – '9'}	
Unique ID	15/12	IMEI/MUID	
Device Name	≤20	'0' – '9' 'a' – 'z' 'A' – 'Z' '-' '_'	
Serial Number	4	0000 – FFFF	
Send Time	14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

3.2.4.10. Start/Stop Report

The command **AT+GTSSR** is used to detect the status of vehicle (Start or Stop status). When the device detects that the vehicle is entering into start status, it will send event message **+RESP:GTSTR** to the backend server. When the vehicle leaves the start status and enters into stop status, it will send event message **+RESP:GTSTP** to the backend server.

➤ **AT+GTSSR=**

Example: AT+GTSSR=gv600mg,1,2,1,5,2,,,,,0017\$				
SN	Parameter	Length (Byte)	Range/Format	Default
1	Password	4 – 7	'0' – '9' 'a' – 'z' 'A' – 'Z'	gv600mg
2	Mode	1	0 1	0
3	Stop Detection Time	<=4	1 – 30 min/5-1800 sec	2
4	Motion Detection Time	<=3	1 – 5 min/5-300 sec	1
5	Start Speed	<=2	1 – 10 Km/h	5
6	Long Stop Detection Time	<=5	0 – 43200 min	0
7	Time Unit	1	0 1	0
8	Reserved	0		
9	Reserved	0		
	Serial Number	4	0000 – FFFF	
	Tail Character	1	\$	\$

- ✧ <Mode>: Working mode.
 - 0: Disable this function
 - 1: Enable this function
- ✧ <Stop Detection Time>: After the vehicle enters into start status, if it rests again and keeps in that status for this time long, the vehicle is considered to exit start status.
- ✧ <Motion Detection Time>: If the vehicle is detected to be moving with ignition on for this time long, it is considered to be in start status.
- ✧ <Start Speed>: The start speed threshold to determine whether the vehicle is start or not. When the device is detected to be moving with ignition on by the built-in motion sensor, it will start to check the speed from GPS. If the device speed stays greater than <Start Speed> longer than <Motion Detection Time>, the vehicle is regarded to be in start status. The event report **+RESP:GTSTR** will be sent. Otherwise, if the device speed stays less than or equal to <Start Speed> longer than <Stop Detection Time>, the vehicle is regarded to exit start status. The event report **+RESP:GTSTP** will be sent. If GPS fix abnormality lasts more than 1 minute, only the built-in motion sensor will be used to detect the start/stop status and the speed will not be checked.
- ✧ <Long Stop Detection Time>: If the duration of static state is more than <Long Stop Detection Time>, the **+RESP:GTLSP** will be sent to backend server, and 0 means to disable.
- ✧ <Time Unit>: It controls the time unit of <Stop Detection Time> and <Motion Detection Time> parameters.

- 0: The time unit is minute.
- 1: The time unit is second.

The acknowledgment message of **AT+GTSSR** command:

➤ **+ACK:GTSSR,**

Example: +ACK:GTSSR,DC0100,862170019025640,,0017,20140511093254,11F0\$			
Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXXFFF, X ∈ {'A' – 'Z', '0' – '9'}	
Unique ID	15/12	IMEI/MUID	
Device Name	<=20	'0' – '9' 'a' – 'z' 'A' – 'Z' ' ' ' _ '	
Serial Number	4	0000 – FFFF	
Send Time	14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

3.2.4.11. iButton Setting

The command **AT+GTACD** is used to configure the parameters of iButton. When the iButton is access, a specified wave shape can be configured to the specified output port. IButton information report in message **+RESP:GTIDA**.

➤ **AT+GTACD**

Example: AT+GTACD=gv600mg,2,0,0,0,0,,,,,0005\$			
Parameter	Length (Byte)	Range/Format	Default
Password	4 – 20	'0' – '9' 'a' – 'z' 'A' – 'Z'	gv600mg
iButton Timer	<=2	0 1 – 10(s)	0
Output ID	1	0-4	0
Output status	1	0 1	0
Duration	<=3	0 – 255(×100ms)	0
Toggle	<=3	0 – 255	0
Reserved			
Reserved			

Reserved			
Reserved			
Reserved			
Serial Number	4	0000 – FFFF	
Tail Character	1	\$	\$

✧ *<iButton Timer>*: Interval of searching the iButton ID or RFID reader DR200.

Note: The number of iButton ID is in opposite order with number that printed on iButton. The ID structure is <1 byte family ID> + <6 byte serial number> + <1 byte CRC>. So the first byte of ID number is iButton's family id.

The acknowledgment message of **AT+GTACD** command:

➤ **+ACK:GTACD,**

Example: +ACK:GTACD, FC0101,135790246811220,,0005,20090214093254,11F0\$			
Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXFFFF, X ∈ {'A' – 'Z', '0' – '9'}	
Unique ID	15/12	IMEI/MUID	
Device Name	<=10	'0' – '9' 'a' – 'z' 'A' – 'Z' '-' '_'	
Serial Number	4	0000 – FFFF	
Send Time	14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

3.2.4.12. Temperature Alarm

This command is used to set temperature-alarm range for the terminal. According to the working mode, the terminal will send event message **+RESP:GTTMP** to the backend server when the device detects the temperature is outside or inside the range.

➤ **AT+GTTMP=**

Example: AT+GTTMP=gv600mg,0,1, 862170019025640,,, -20,50,,,2,10,,,1,1,0,0,,,,,000C\$				
SN	Parameter	Length (Byte)	Range/Format	Default
1	Password	4 – 7	'0' – '9' 'a' – 'z' 'A' – 'Z'	gv600mg
2	Alarm ID	1	0-7	

3	Mode	1	0-3	0
4	Sensor ID	16	'0' – '9' 'a' – 'f' 'A' – 'F'	
5	Reserved	0		
6	Reserved	0		
7	Low Temperature	<=3	-55 – 125℃	0
8	High Temperature	<=3	-55 – 125℃	0
9	Reserved	0		
10	Reserved	0		
11	Validity	<=2	1 – 10	2
12	Send Interval	<=2	0 – 60	10
13	Reserved	0		
14	Reserved	0		
15	Output ID	1	0 – 4	0
16	Output Status	1	0 1	0
17	Duration	<=3	0 – 255(×100ms)	0

21	Reserved	0		
22	Reserved	0		
	Serial Number	4	0000 – FFFF	
	Tail Character	1	\$	\$

- ✧ <Index>: The index of the Bluetooth accessory. All 10 groups can be used for Bluetooth beacon accessories.
- ✧ <Accessory Type>: The type of the Bluetooth accessory which is defined in the <Index>. The following is supported now:
 - 0: No Bluetooth accessory.
 - 5: BLE lock. Five reserved parameters are used as follows:

Unlock Timeout	<=4	60-1800(S)	600
Reserved	0		
Reserved	0		
Reserved	0		
Reserved	0		

- ✧ <Unlock Timeout>: When unlock success or unlock timeout, the device will report message **+RESP:GTBAA** to back server.
 - 6: Beacon Multi-Functional Sensor.
 - 8: External Input Output Bluetooth Accessory.

Note: The input/output configuration of the accessory can be found in the **AT+GTIEX**, **AT+GTAEX** and **AT+GTOEX**.
- ✧ <Accessory Model>: The model of the Bluetooth accessory which is defined in <Accessory Type>. The following is supported now:
 - The model of Beacon Multi-Functional Sensor (<Accessory Type> is 6):
2: WTH300.
 - The External Input Output Bluetooth Accessory (<Accessory Type> is 8):

0: WBC300.

Note: The current version supports only one WBC300 configuration.

- ✧ <Accessory Name>: The name of the Bluetooth accessory.
- ✧ <Accessory MAC>: The MAC address of the Bluetooth accessory.
Note: If <Accessory MAC> of Bluetooth beacon accessory is empty, the device will search for the Bluetooth beacon accessory by <Accessory Name>. The name must be unique. Since the name of the Bluetooth beacon accessory is variable while the MAC address of the Bluetooth beacon accessory is unique, so it is recommended to use the MAC address to scan Bluetooth beacon accessories.
- ✧ <Append Mask>: Bitwise mask to configure the composition of Bluetooth accessory info. If the device obtains the data from Bluetooth accessories, and the Bit 8 for the Bluetooth accessory data of <ERI Mask> in **AT+GTFRI** is set to 1, the device will report **+RESP:GTERI** including the data obtained from Bluetooth accessories instead of **+RESP:GTFRI**. In **+RESP:GTBAA** message, the Bluetooth accessories data will be included according to the mask set by this field.
 - Bit 0: Bluetooth accessory name.
 - Bit 1: Bluetooth accessory MAC.
 - Bit 2: Bluetooth accessory connection status. This bit is only effective when the Bluetooth accessory is a Bluetooth connectable accessory. It will always be 0 when the Bluetooth accessory is a Bluetooth beacon accessory.
 - Bit 3: Bluetooth accessory battery voltage.
 - Bit 4: Bluetooth accessory temperature.
 - Bit 5: Accessory Humidity
 - Bit 6: Reserved
 - Bit 7: Accessory input output data (Including <Accessory Output Status> <Accessory Digital Input Status> and <Accessory Analog Input Status>)

Note: If <Accessory Type> 5 (BLE Lock) only supports reporting Bluetooth accessory MAC.

- ✧ <Read Interval>: The interval for reading data from the Bluetooth accessory. If <Accessory Type> 5 (BLE lock) is selected, this parameter is invalid.
- ✧ <Low Voltage Threshold>: Specify the lower limit voltage. When the voltage of Bluetooth accessory is below this value, the device will report message **+RESP:GTBAA** to backend server. 0 means disable low voltage detection. If <Accessory Type> 5 (BLE lock) is selected, this parameter is invalid.
- ✧ <Output ID>: The ID of the output port to output the specified waveform when the **+RESP:GTBAA** event is detected. If <Accessory Type> 5 (BLE lock) is selected, unlock success will not trigger output.

The acknowledgment message of **AT+GTBAS** command:

➤ **+ACK:GTBAS,**

Example:			
+ACK:GTBAS,DC0100,135790246811220,,010A,20191016102313,02A6\$			
Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXXFFF, X ∈ {‘A’ – ‘Z’, ‘0’ – ‘9’}	

Unique ID	15/12	IMEI/MUID	
Device Name	<=20	'0' – '9' 'a' – 'z' 'A' – 'Z' '-' '_'	
Serial Number	4	0000 – FFFF	
Send Time	14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

3.2.5.3. Bluetooth Beacon ID Setting

The command **AT+GTBID** is used to scan the device with Bluetooth beacon ID accessories. The parameter *<Mode>* in the command **AT+GTBTS** must be 1 or 2.

➤ AT+GTBID=

Example:

AT+GTBID=gv600mg,,1,0,001F,2400,,1,15,B80EA1003C06,,B80EA100A00A,,B80EA11067E8,,,,,B80EA1104007,,,,B80EA10017F2,1,1,31,,,,0,0,0,,,FFFF\$

SN	Parameter	Length (Byte)	Range/Format	Default
1	Password	4 – 20	'0' – '9' 'a' – 'z' 'A' – 'Z'	gv600mg
2	Reserved	0		
3	Enable	1	0 1	
4	Beacon ID Accessory Model	1	0 - 9	0
5	Append Mask	<=4	0 - FFFF	1F
6	Low Voltage Threshold	<=4	0 – 5000mV	2400
7	Reserved	0		
8	Start Index	<=3	1 – 15	1
9	End Index	<=3	1– 15	1
10	MAC List	<=12*15		
11	Reserved (Optional)	0		
12	Reserved (Optional)	0		
13	Reserved (Optional)	0		
14	Reserved (Optional)	0		
15	Reserved (Optional)	0		
16	Reserved	0		

17	Output ID	1	0–4	0
18	Output Status	1	0 1	0
19	Duration	<=3	0 – 255(×100ms)	0
20	Toggle Times	<=3	0 – 255	0
21	Reserved	0		
22	Reserved	0		
	Serial Number	4	0000 – FFFF	
	Tail Character	1	\$	\$

✧ <Enable>: Whether to support the Bluetooth beacon ID accessories.

- 0: Not support.
- 1: Support.

✧ <Beacon ID Accessory Model>: The model of the Bluetooth accessory. The following is supported now:

0: WKF300. Two reserved parameters are used as follows:

Push Button Event	1	0 1	0
Keyfob Detect mode	1	0 -2	0
Keyfob Detect Interval	<=3	30 – 600(s)	30
Reserved	0		
Reserved	0		

✧ <Push Button Event>: If this parameter is set to 1 and press the WKF300, the device will report message **+RESP:GTBAA** to backend server.

✧ <Keyfob Detect Mode>: It specifies the mode of detecting Keyfob

- 0: Disable the Keyfob detecting mode
- 1: After entering ignition on and moving state, the device will scan Keyfobs one time for the time period specified by <Keyfob Detect Interval> and then will send the **+RESP:GTBID** message to report information of Keyfob(s). If more than 3 Keyfobs are detected, the **+RESP:GTBID** message contains information of top 3 Keyfobs with the strongest signal.
- 2: After entering ignition on and moving state, the device will keep scanning Keyfobs continuously. If the device detects change of available Keyfob(s) over two successive time intervals specified by <Keyfob Detect Interval>, it will send the **+RESP:GTBID** message to report information of Keyfob(s). If more than 3 Keyfobs are detected, the **+RESP:GTBID** message contains information of top 3 Keyfobs with the strongest signal.

✧ <Keyfob Detect Interval>: It specifies the interval of detecting Keyfob.

✧ <Append Mask>: In **+RESP:GTBAA** message, the Bluetooth accessories data items will be reported according to the mask set by this field.

- Bit 0: Reserved.

- Bit 1: Bluetooth accessory MAC.
 - Bit 2: Reserved.
 - Bit 3: Bluetooth accessory battery voltage.
 - Bit 4: Reserved.
- ✧ **<Low Voltage Threshold>**: Specify the lower limit voltage. When the voltage of Bluetooth accessory is below this value, the device will report message **+RESP:GTBAA** to back server. 0 means to disable low voltage detection.
- ✧ **<Start Index>, <End Index>**: The index range of the MAC list to which the MAC addresses are to be updated. For example, if **<Start Index>** is set to 1 and **<End Index>** is set to 2, then the first two MAC addresses in the MAC list will be updated by the MAC addresses provided in the parameter **<MAC List>**. **<Start Index>** and **<End Index>** determine the total amount of MAC addresses that will be updated. If either one is empty, there should be no **<MAC List>** following the empty value. A maximum of 15 MAC addresses can be updated each time.
- ✧ **<MAC List>**: A list of comma-separated MAC address to be updated to the MAC list. The quantity of the MAC addresses are determined by **<Start Index>** and **<End Index>**.
- Note:** If more accessories are needed, please adjust **<Start Index>** and **<End Index>** for appropriate setup. If some MAC addresses in **<MAC List>** are empty, then the corresponding MAC address will be deleted. For example, to delete the 4th, 5th and 6th MAC addresses of the **<MAC List>**, please set **<Start Index>** to 4 and set **<End Index>** to 6 and keep the three MAC addresses of **<MAC List>** empty.
- ✧ **<Output ID>**: The ID of the output port to output the specified waveform when the **+RESP:GTBAA** or **+RESP:GTBID** event is detected.

The acknowledgment message of **AT+GTBID** command:

➤ **+ACK:GTBID,**

Example:

Unique ID	15/12	IMEI/MUID	
Device Name	<=20	'0' – '9' 'a' – 'z' 'A' – 'Z' '-' '_'	
Serial Number	4	0000 – FFFF	
Send Time	14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

3.2.6. IO Application

3.2.6.1. Digital Output Port Settings

The **AT+GTOUT** command is used to set specified waveform from the digital output ports. Total

four waveforms are supported as below. If it is set to waveform 1, the device will maintain this waveform at the specified output port after power reset.

The digital output 1 is a latched output. The final status of the output will be latched during power off. It supports only waveform 1.

The output port will output square wave if it is set to waveform 4. The waveform will be output only when the main power supply is connected. The waveform will still be output even if the device is rebooted.

Waveform 1:

✓ <Duration> = 0ms, <Toggle Times> = 0

Figure: Waveform 1

Waveform 2:

✓ <Duration> = 500ms, <Toggle Times> = 1

Figure 2: Waveform 2

Waveform 3:

✓ <Duration> = 800ms, <Toggle Times> = 3

Figure 3: Waveform 3

Waveform 4:

✓ <Duration> = 800ms, <Toggle Times> = 0

Figure 5: Waveform 4

➤ **AT+GTOUT=**

Example:				
AT+GTOUT=gv600mg,1,0,0,0,0,0,0,0,0,0,0,0,1,1,1,1,1,0004\$				
SN	Parameter	Length (Byte)	Range/Format	Default
1	Password	4 – 7	'0' – '9' 'a' – 'z' 'A' – 'Z'	gv600mg
2	Output1 Status	1	0 1	0
3	Duration	<=3	0-255(*100ms)	0
4	Toggle Times	<=3	0-255	0
5	Output2 Status	1	0 1	0
6	Duration	<=3	0 – 255(×100ms)	0
7	Toggle Times	<=3	0 – 255	0
8	Output3 Status	1	0 1	0
9	Duration	<=3	0 – 255(×100ms)	0
10	Toggle Times	<=3	0 – 255	0
11	Output4 Status	1	0 1	0
12	Duration	<=3	0 – 255(×100ms)	0
13	Toggle Times	<=3	0 – 255	0
14	DOS Report	1	0-F	0
15	Long Operation1	<=3	0 – 120min	0
16	Long Operation2	<=3	0 – 120min	0
17	Long Operation3	<=3	0 – 120min	0
18	Long Operation4	<=3	0 – 120min	0
	Serial Number	4	0000 – FFFF	
	Tail Character	1	\$	\$

✧ <Output1–4 Status>: Used only for the waveform 1 as shown in Figure to set the final status

of the output port.

- 0: Disable status.
- 1: Enable status.

✧ <Duration>: Please refer to Figure, Figure 2 and Figure 3. Unit is 100ms.

✧ <Toggle Times>: Please refer to Figure, Figure 2 and Figure 3.

When the <Duration> is set to 0, the <Toggle Times> must be set to 0. Otherwise the command may be invalid.

✧ <DOS Report>: Output status changes with waveform 1, whether to report **+RESP: GTDOS** or not.

- Bit 0: for output 1 report +RESP:GTDOS
- Bit 1: for output 2 report +RESP:GTDOS
- Bit 2: for output 3 report +RESP:GTDOS
- Bit 3: for output 4 report +RESP:GTDOS

For each bit, set it to 1 to enable and 0 to disable.

✧ <Long Operation1> and <Long Operation4>: The long operation time for output 1 and output 4. After the long time passed, the output waveform will be reset to the initial status at the specified output port. These two parameters would be effective only when the output waveform is 1 or 4.

The acknowledgment message of **AT+GTOUT** command:

➤ **+ACK:GTOUT,**

Device Name	<=20	'0' – '9' 'a' – 'z' 'A' – 'Z' '-' '_'	
Serial Number	4	0000 – FFFF	
Send Time	14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

3.2.6.2. External Power Supply Monitoring

The command **AT+GTEPS** is used to configure the parameters of external power supply monitoring. The device will measure and monitor the voltage of the external power supply. If the voltage of the external power supply matches the predefined alarm condition, the device will send an alarm message **+RESP:GTEPS** to the backend server to notify the status of the external power supply.

To make sure this function works in all situations, please switch on the internal backup battery in case that the voltages of the external power supply drops too low.

➤ **AT+GTEPS=**

Example: AT+GTEPS=gv600mg,1,8000,12000,,0,0,0,0,00,200,,0,1,8000,12000,,0,0,0,0,0,FFFF\$				
SN	Parameter	Length (Byte)	Range/Format	Default
1	Password	4 – 7	'0' – '9' 'a' – 'z' 'A' – 'Z'	gv600mg
2	Mode	1	0 1 2	0
3	Min Threshold	<=5	250 – 32000 mV	250
4	Max Threshold	<=5	250 – 32000 mV	450
5	Reserved			
6	Debounce Time	1	0 – 255 (×10s)	6
7	Output ID	1	0 – 4	
8	Output Status	1	0 1	
9	Duration	<=3	0 – 255(×100ms)	0
10	Toggle Times	<=3	0 – 255	0
11	Sync with FRI	2	00 01 10 11	00
12	Hysteresis Error	<=4	0 – 2000mV	200
13	Reserved			
14	MPN/MPF Validity Time	<=3	0 – 255 (×1s)	0
15	Mode for external power supply 2	1	0 1 2	
16	Min Threshold 2	<=5	250 – 32000 mV	
17	Max Threshold 2	<=5	250 – 32000 mV	
18	Reserved			
19	Debounce Time	1	0 – 255 (×10s)	6
20	Output ID 2	1	0 – 4	
21	Output Status 2	1	0 1	
22	Duration 2	<=3	0 – 255(×100ms)	
23	Toggle Times 2	<=3	0 – 255	
	Serial Number	4	0000 – FFFF	

	Tail Character	1	\$	\$
--	----------------	---	----	----

- ✧ **<Mode>**: Working mode of the external power supply monitoring.
 - 0: Disable the external power supply monitoring.
 - 1: Enable the external power supply monitoring. If the current voltage is within the range of (<Min Threshold>, <Max Threshold>), the **+RESP:GTEPS** alarm will be triggered.
 - 2: Enable the external power supply monitoring. If the current voltage is outside the range of (<Min Threshold>, <Max Threshold>), the **+RESP:GTEPS** alarm will be triggered.
- ✧ **<Min Threshold>**: The lower limit of the voltage of the external power supply to trigger the alarm.
- ✧ **<Max Threshold>**: The upper limit of the voltage of the external power supply to trigger the alarm.
- ✧ **<Sample Period>**: The sampling period to measure the external power supply.
- ✧ **<Debounce Time>**: The time for debouncing to avoid abnormal voltage drop of the external power supply.
- ✧ **<Output ID>**: Specify the ID of the output port (1 to 4) to output specified waveform when the **+RESP:GTEPS** alarm is triggered. If it is set to 0, there is no output waveform.
- ✧ **<Sync with FRI>**: Besides the **+RESP:GTEPS** alarm report, the device can also send the voltage of external power supply periodically along with the fixed report.
 - 00: Do not report external power supply voltage with fixed report.
 - 01: Report external power supply voltage with fixed report.
 - 10: Report second external power supply voltage with fixed report.
 - 11: Report two external power supply voltages with fixed report.
- ✧ **<MPN/MPF Validity Time>**: The validity time for detecting the device connecting or disconnecting to the main power supply. 0 means "Do not check the validity time". If <MPN/MPF Validity Time> is not 0, and the device remains connected or disconnected to the main power supply for the period of time specified by this parameter, the device will report **+RESP:GTMPN** or **+RESP:GTMPF** to the backend server. If it is detected that the device connects or disconnects to the main power supply when <MPN/MPF Validity Time> is 0, the device will report **+RESP:GTMPN** or **+RESP:GTMPF** to the backend server.
- ✧ **<Hysteresis Error>**: It is an offset to the <Min Threshold> and <Max Threshold>. It can be used to suppress the bouncing of external power supply voltage detection. If this parameter is set, the limit to trigger the alarm is calculated as following:
 - Outside the range: detected voltage is greater than <Max Threshold> + <Hysteresis Error> or less than <Min Threshold>.
 - Inside the range: detected voltage is higher than <Min Threshold> + <Hysteresis Error> or less than <Max Threshold>.

The acknowledgment message of **AT+GTEPS** command:

➤ **+ACK:GTEPS,**

Example:

+ACK:GTEPS,DC0100,862170019025640,,0007,20140511093254,11F0\$			
Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXXFFF, X ∈ {'A' – 'Z', '0' – '9'}	
Unique ID	15/12	IMEI/MUID	
Device Name	<=20	'0' – '9' 'a' – 'z' 'A' – 'Z' '-' '_'	
Serial Number	4	0000 – FFFF	
Send Time	14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

3.2.6.3. Digital Input Port Setting

The command **AT+GTDIS** is used to configure the parameters of 4 digital input ports. Input <Ignition Detection Port ID> is dedicated for ignition detection. The rest four inputs are customizable. If the logical status of any one of the four digital inputs ports is changed, the device will send message **+RESP:GTDIS** to the backend server.

Before using digital input 1-4, <IO Mode> in **AT+GTCFG** command must be set to 0 on corresponding bit.

➤ AT+GTDIS=

Example: AT+GTDIS=gv600mg,0,,5,0,1,0,0,0,2,0,0,0,3,0,0,0,4,0,0,FFFF\$				
SN	Parameter	Length (Byte)	Range/Format	Default
1	Password	4 – 7	'0' – '9' 'a' – 'z' 'A' – 'Z'	gv600mg
2	Ignition Detection Port ID	1	0	0
3	Position Type	1	0 1	0
4	Debounce Time	<=2	0 – 20(×10ms)	5
5	No ignition	1	0 1	0
6	Input ID 1	1	1	1
7	Enable	1	0 1	0
8	Debounce Time	<=2	0 – 20(×10ms)	0
9	Validity Time	<=2	0 1 – 12(×2s)	0
10	Input ID 2	1	2	2
11	Enable	1	0 1	0

12	Debounce Time	≤ 2	0 – 20($\times 10\text{ms}$)	0
13	Validity Time	≤ 2	0 1 – 12($\times 2\text{s}$)	0
14	Input ID 3	1	3	3
15	Enable	≤ 2	0 1	0
16	Debounce Time	0	0 – 20($\times 10\text{ms}$)	0
17	Validity Time	≤ 2	0 1 – 12($\times 2\text{s}$)	0
18	Input ID 4	1	4	4
19	Enable	1	0 1	0
20	Debounce Time	≤ 2	0 – 20($\times 10\text{ms}$)	0
21	Validity Time	≤ 2	0 1 – 12($\times 2\text{s}$)	0
	Serial Number	4	0000 – FFFF	
	Tail Character	1	\$	\$

- ✧ <Ignition Detection Port ID>: The ignition detection port.
- ✧ <Position Type>: This parameter indicates the type of position info included in +RESP:GTDIS report.
 - 0: Including real time position in the report.
 - 1: Including the last known position in the report.
- ✧ <Input ID 1-4>: The digital input port IDs.
- ✧ <Debounce Time>: The sampling period of the non-interruptible input port.
- ✧ <Enable>: Enable or disable the interrupt input.
 - 0: Disable
 - 1: Enable
- ✧ <Debounce Time>: The debouncing time for interruptible input port.
- ✧ <No ignition>: No Ignition wire connection.
 - 0: Ignition signal connected
 - 1: No ignition signal for virtual ignition, the device generates +RESP:GTVGN and +RESP:GTVGF report.
- ✧ <Validity Time>: The validity time of the input port. 0 means not to check the validity time.

The acknowledgment message of **AT+GTDIS** command:

➤ **+ACK:GTDIS,**

Example:			
+ACK:GTDIS,DC0100,862170019025640,,0005,20140511093254,11F0\$			
Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXXFFF, $X \in \{'A' - 'Z', '0' - '9'\}$	

Unique ID	15/12	IMEI/MUID	
Device Name	<=20	'0' – '9' 'a' – 'z' 'A' – 'Z' '-' '_'	
Serial Number	4	0000 – FFFF	
Send Time	14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

3.2.6.4. Input/output Port Binding

This command is used to configure the user-defined output port action triggered by input ports. After the IO combination is set and corresponding condition occurs, the device will output specified waveform at the specified output port. The device will send message **+RESP:GTIOB** to the backend server when the logical status of bound input ports changes.

➤ AT+GTIOB=

Example: AT+GTIOB=gv600mg,1,F,A,3,1,0,8,3,,,,,0006\$				
SN	Parameter	Length (Byte)	Range/Format	Default
1	Password	4 – 7	'0' – '9' 'a' – 'z' 'A' – 'Z'	gv600mg
2	IOB ID	1	0 – 3	
3	Input Mask	2	0 – 1F	0
4	Trigger Mask	2	0 – 1F	0
5	Input Sample Period	<=2	0 1 – 12(×2s)	0
6	Output ID	1	0 – 4	0
7	Output Status	1	0 1	0
8	Duration	<=3	0 – 255(×100ms)	0
9	Toggle Times	<=3	0 – 255	0
10	Reserved	0		
11	Reserved	0		
12	Reserved	0		
13	Reserved	0		
	Serial Number	4	0000 – FFFF	
	Tail Character	1	\$	\$

- ✧ <IOB ID>: ID of the user-defined IO binding.
- ✧ <Input Mask>: Bitwise mask for input port composition. Each bit, from bit 0 to bit 4, represents one digital input port. Set it to 1 to enable and 0 to disable corresponding input port.
 - bit0: ignition detection
 - bit1: digital input 1
 - bit2: digital input 2
 - bit3: digital input 3
 - bit4: digital input 4
- ✧ <Trigger Mask>: bitwise mask for trigger condition composition of the corresponding input ports. Each bit, from bit 0 to bit 4, represents the logical status of the corresponding input port to trigger the IOB event. Set it to 1 to use enabled status as the trigger condition and 0 to use disabled status. Only when the logical status of all the input ports in one IO binding meets the trigger condition is the IOB event triggered.
 - bit0: ignition detection
 - bit1: digital input 1
 - bit2: digital input 2
 - bit3: digital input 3
 - bit4: digital input 4
- ✧ <Input Sample Period>: The period to check the status of all the digital input ports in one IO binding. **AT+GTIOB** and **AT+GTDIS** use independent sample period to check the input port status even for the same input port.
- ✧ <Output ID>: ID of the output port to output specified waveform when the trigger condition meets. 0 means no waveform will be output.

The acknowledgment message of **AT+GTIOB** command:

➤ **+ACK:GTIOB,**

Example: +ACK:GTIOB,DC0100,862170019025640,,1,0006,20140511093254,11F0\$			
Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXXFFF, X ∈ {'A' – 'Z', '0' – '9'}	
Unique ID	15/12	IMEI/MUID	
Device Name	<=20	'0' – '9' 'a' – 'z' 'A' – 'Z' '-' '_'	
IOB ID	1	0 – 3	
Serial Number	4	0000 – FFFF	
Send Time	14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

3.2.6.5. Analog Input Port Setting

The command **AT+GTAIS** is used to configure the parameters of analog input ports.

Make sure there is analog signal connected to the corresponding analog input port before carrying out settings to that port.

➤ **AT+GTAIS=**

Example: AT+GTAIS=gv600mg,1,0,250,2700,2,,1,1,0,0,1,,,2,1,250,2700,2,,1,1,0,0,1,,,,,0008\$				
SN	Parameter	Length (Byte)	Range/Format	Default
1	Password	4~7	'0'~'9' 'a'~'z' 'A'~'Z'	gv600mg
2	Analog Input ID1	1	1	1
3	Mode	1	0 1 2 3 4 5	0
4	Min Threshold	<=5	0~32000 mV	
5	Max Threshold	<=5	0~32000 mV	
6	Sample Rate	<=2	0 1~12(×2s)	0
7	Reserved	0,TBD		
8	Output ID	1	0~4	
9	Output Status	1	0 1	
10	Duration	<=3	0~255(×100ms)	0

28	Fuel Sensor Delay Time	≤ 3	0-600 sec	30
29	Fuel Loss Alarm	≤ 2	0-50	10
30	Sampling Number	≤ 3	0-150	20
31	Fuel Level Change Threshold	≤ 2	0-50%	0
	Serial Number	4	0000~FFFF	
	Tail Character	1	\$	\$

- ✧ *<Analog Input ID 1>*: The analog input port ID.
- ✧ *<Mode>*: Working mode of the analog input alarm (**+RESP: GTAIS**).
 - 0: Disable analog input alarm.
 - 1: Enable analog input alarm. If the current input voltage is within the range of (*<Min Threshold>*, *<Max Threshold>*), the alarm will be triggered.
 - 2: Enable analog input alarm. If the current input voltage is outside the range of (*<Min Threshold>*, *<Max Threshold>*), the alarm will be triggered.
 - 3: Connect with special fuel level sensor to support fuel level reporting and monitoring.
Note: when the selected mode is 3, please do not choose the waveform 1 as the specified output waveform.
 - 4: No alarm mode. The range of the voltage will be ignored and no alarm will be triggered.
 - 5: Voltage processed mode. The range of the voltage will be ignored and no alarm will be triggered. But the voltage will be processed before being reported.
- ✧ *<Min Threshold>*: If *<Mode>* is set to 1 or 2, this is the lower limit of the voltage of the analog input port to trigger the alarm.
- ✧ *<Max Threshold>*: If *<Mode>* is set to 1 or 2, this is the upper limit of the voltage of the analog input port to trigger the alarm.
- ✧ *<Sample Rate>*: The sampling period of the analog input port.
- ✧ *<Output ID>*: Specify the ID of the output port (1 to 4) to output specified waveform when the analog input alarm is triggered. If it is set to 0, there is no output waveform.
- ✧ *<Output Status>*: set the final status of the output port.
 - 0: Disable status.
 - 1: Enable status.
- ✧ *<Toggle Times>*: The times of the square-wave.
- ✧ *<Sync with FRI>*: The device can send the analog input voltage periodically along with fixed

message. Set this field to 1 to enable it and 0 to disable. If the analog input port is used to work with a fuel sensor and the *<Sync with FRI>* is enabled, the device will send the fuel level together with the fixed message.

- ✧ *<Fuel Level Debounce>*: Number of the data discarded when calculating the fuel level.
- ✧ *<Fuel Sensor Delay Time Time>*: After power on or enabling the fuel level reporting and monitoring function, the fuel sensor reports correct fuel level after *<Fuel Sensor Delay Time Time>*.
- ✧ *<Fuel Loss Alarm>*: If the difference between the current fuel level after ignition on and the last measured fuel level before previous ignition off is greater than this value, an unusual fuel consumption alarm is sent with the event message +RESP:GTFLA.
- ✧ *<Sampling Number>*: This parameter defines the total number of sample readings from the fuel sensor for calculating the current fuel level. And it must be larger than *<Fuel Level Debounce>*.
- ✧ *<Fuel Level Change Threshold>*: This parameter defines the threshold of the value change. The value change must be greater than this defined threshold to trigger it. This value should not be greater than *<Fuel Loss Alarm>*, otherwise the +RESP:GTFLA may be reported incorrectly.

The acknowledgment message of **AT+GTAIS** command:

➤ **+ACK:GTAIS,**

Example:			
+ACK:GTAIS,DC0100,862170019025640,,0008,20140511093254,11F0\$			
Parameter	Length (Byte)	Range/Format	Default

Tail Character	1	\$	\$

3.2.7. Main Serial Port Application

3.2.7.1. Main Serial Port Setting

The serial port of the device is used to connect to external devices to extend the application of the device. The command **AT+GTMUT** is used to configure the working mode of the serial port for different external devices and the parameters for the serial port communication.

➤ **AT+GTMUT=**

Example: AT+GTMUT=gv600mg,1,12,8,1,0,0,0,,,FFFF\$				
SN	Parameter	Length (Byte)	Range/Format	Default
1	Password	4~7	'0'~'9' 'a'~'z' 'A'~'Z'	gv600mg
2	Working Mode	<=2	0 1 4	0
3	Baudrate Index	<=2	1 – 12	5
4	Data Bits	1	8	8
5	Stop Bits	1	1 – 3	1
6	Parity Bits	1	0 – 4	0
7	Sleep Enable	1	0 1	0
8	Input ID of Wakeup	0	0 1-4	0
9	Reserved (Optional)	0	0	0
10	Reserved (Optional)	0	0	
	Serial Number	4	0000~FFFF	
	Tail Character	1	\$	\$

✧ <Working Mode>: It configures the working mode of UART.

- 0: Disable UART.
- 1: Use UART to transfer data via **AT+GTDAT** and other protocol commands. When executing **AT+GTDAT** command, the device will send execution result to the second serial port. "OK" is returned when the command is executed successfully, and "Error" is returned when the command fails to execute.

9	Hex convert mode	1	0 1	0
10	Reserved	0	0	

<Hex convert mode>: if this mode is enabled, it means the UART uses hex data.

- 4: Used for digital fuel sensor. Two reserved parameters are used as follows.

9	Digital Fuel Sensor Type	1	2 4	2
10	Reserved	0	0	

Note: DUT Fuel Sensor Type is 2 by default and UFSXXX type is 4 by default. Make sure the baud rate is suitable for the sensor and the default baud rate is 19200.

✧ <Baudrate Index>: The index of the supported baud rate of the serial port. All supported baud rates are listed as below:

Baudrate Index	Baud Rate
1	1200
2	2400
3	4800
4	7200

5	9600
6	14400
7	19200
8	28800
9	33900
10	38400
11	57600
12	115200

- ✧ <Data Bits>: Data bits of the UART. Their values can be 8.
- ✧ <Stop Bits>: Stop bits of the UART. Their values can be 1, 2 or 3.
 - 1: 1 Stop Bits.
 - 2: 2 Stop Bits.
 - 3: 1.5 Stop Bits.
- ✧ <Parity Bits>: Parity Bits of the UART. Their values can be 0, 1, 2, 3, or 4.
 - 0: None Parity.
 - 1: Odd Parity.
 - 2: Even Parity.
 - 3: Space Parity.
 - 4: Mark Parity.
- ✧ <Enable Sleep>: The device supports sleep mode which helps reduce power consumption. When the device enters into the sleep mode, the response to the serial port will be very slow unless the device is waked up. This parameter is used to enable or disable the sleep mode of the device.
 - 0: Disable the device sleep mode.
 - 1: Enable the device sleep mode.
- ✧ <Input ID for Wakeup>: The ID of the digital input of gv600mg used to wake up the device from the low power mode.
 - 0: Do not use digital input to wake up the device.
 - 1-4: The external device uses digital input to wake up the device.
- ✧ <Digital Fuel Sensor Type>: The type of digital fuel sensor connected to serial port.
 - 0: Reserved.
 - 1: Reserved.
 - 2: DUT-E.
 - 3: Reserved.
 - 4: UFSxxx.
 - 5: Reserved.
 - 6: Reserved.

Note: The device can receive all the AT commands only when it works under mode 0 and the GTMUT command is always supported regardless the setting of the mode.

The acknowledgment message of the **AT+GTMUT** command:

➤ **+ACK:GTMUT,**

Example:

+ACK:GTMUT,DC0100,862170019025640,,0018,20090214093254,11F0\$

Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXFFFF, X∈{'A' – 'Z','0' – '9'}	
Unique ID	15/12	IMEI/MUID	
Device Name	<=20	'0' – '9' 'a' – 'z' 'A' – 'Z' '-' '_'	
Serial Number	4	0000 – FFFF	
Send Time	14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

3.2.7.2. ID Authentication

The command **AT+GTIDA** is used to protect against unauthorized use. This function needs an iButton and an external relay. To use this command, make sure both the iButton and the external relay are connected to the device. When the device reads an ID, it will report event report **+RESP:GTIDA** to the server. If the ID is in the white list, it will be authorized until next time ignition off. After the ignition off again, the authentication valid time will last for a short period of time (settable). Within this period, the driver can turn on the engine again without reidentification.

➤ AT+GTIDA=

Example:

AT+GTIDA=gv600mg,1,1,2,D2C4FBC5,87654321,45,3,,,,,1,1,0,,,,,FFFF\$

Parameter	Length (Byte)	Range/Format	Default
Password	4 – 20	'0' – '9' 'a' – 'z' 'A' – 'Z'	gv600mg
Mode	1	0/1/2	0
Start Index	<=2	1 – 250	
End Index	<=2	1 – 250	
ID Number List	<=8*20	'0' – '9','a' – 'f', 'A' – 'F'	
Timeout After Ignition Off	<=3	0/15 – 600sec	30
Report Mode	1	0 – 7	0
ID Valid Time	<=3	15 – 600sec	30
Reserved	0		
Reserved	0		
Reserved	0		

Output ID	1	0 – 4	0
Output Status	1	0/1	0
Duration	<=3	0 – 255(×100ms)	0
Toggle Times	<=3	0 – 255	0
Reserved	0		
Reserved	0		
Reserved	0		
Reserved	0		
Serial Number	4	0000 – FFFF	
Tail Character	1	\$	\$

- ✧ <Mode>: Working mode of the ID authentication function.
 - 0: Disable.
 - 1: Only authorized ID cards can unlock the vehicle.
 - 2: Any ID cards can unlock the vehicle.
- ✧ <Start Index>,<End Index>: The index range of the white list to which the ID numbers are to be updated. For example, if the <Start Index> is set to 1 and the <End Index> is set to 2, then the first two ID numbers in the white list will be updated by the numbers provided in the parameter <ID Number List>. The <Start Index> and <End Index> define the total amount of ID numbers that will be updated. If either one is empty, there should be no <ID Number List> parameter following the Index. A maximum of 8 numbers can be updated each time.
- ✧ <ID Number List>: A list of comma-separated ID number to be updated to the white list. The amount of the ID numbers are determined by <Start Index> and <End Index>.
- ✧ <Timeout After Ignition Off>: When the ignition off, it will still be authorized for a short time. In this period, re-authentication is not needed. 0 means “Lock the vehicle when ignition off”.
- ✧ <Report Mode>:
 - Bit 0: Report the ID which is authorized.
 - Bit 1: Report the ID which is unauthorized.
 - Bit 2: Report the ID which has logged out. (If authorized ID meets the trigger conditions <ID Valid Time> and <Timeout After Ignition Off>, then IDA report will be sent to indicate the log-out event).

For each bit, set it to 1 enable the report, and 0 disable the report. If <Report Mode> is 0, no report related to **+RESP:GTIDA** will be reported.
- ✧ <ID Valid Time>: It will remain authorized for this period of time when the ID is valid.
- ✧ <Output ID>: It Specified the ID of the output port to output specified waveform when it is authorized. Only the waveform 1 is supported.

The acknowledgment report of the **AT+GTIDA** command:

➤ **+ACK:GTIDA,**

Example:

+ACK: GTIDA,DC0100,862170013895931,,FFFF,20110101000009,0088\$			
Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXFFFF, X ∈ {'A' – 'Z','0' – '9'}	
Unique ID	15/12	IMEI/MUID	
Device Name	<=10	'0' – '9' 'a' – 'z' 'A' – 'Z' '-' '_'	
Serial Number	4	0000 – FFFF	
Send Time	14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

Note:

Make sure the total size of the command is not more than 160 bytes if it is sent via SMS.

3.2.7.3. External Digital Fuel Sensor

The command **AT+GTEFS** is used to configure the parameters of the external digital fuel sensor. Only when <Working Mode> in **AT+GTMUT** is set to 4, the parameters of this command will be effective.

➤ **AT+GTEFS=**

Example: AT+GTEFS=gv600mg,,,9999,30,10,,,,,0,,,,,FFFF\$			
Parameter	Length (Byte)	Range/Format	Default
Password	4 – 20	'0' – '9' 'a' – 'z' 'A' – 'Z'	gv600mg
Reserved	0		
Reserved	0		
Ex Full Value	<= 5	0 – 65535	9999
Ex Fuel Sensor Delay Time	<=3	0 30- 600 sec	30
Ex Fuel Loss Alarm	<=2	0 – 50%	10
Reserved	0		
Reserved	0		
Reserved	0		
Reserved	0		
Report Sensor Data	1	0/1	0
Reserved	0		

Reserved	0		
Reserved	0		
Reserved	0		
Serial Number	4	0000 – FFFF	
Tail Character	1	\$	\$

- ✧ <Ex Full Value>: The value read from the sensor when the fuel tank is full.
Note: This value needs to be set only for UFSxxx, and it is not required by the other sensors. The unit for DUT-E is 1mm. DUT-E can use <Ex Full Value> to calculate the percentage of fuel level.
- ✧ <Ex Fuel Sensor Delay Time>: After ignition on, before reporting the fuel level, the fuel sensor will be delayed for the period of time defined by <Ex Fuel Sensor Delay Time>.
- ✧ <Ex Fuel Loss Alarm>: If the difference between the current fuel level after ignition off and the last measured fuel level is greater than this value, an abnormal fuel consumption alarm will be sent to the backend server with event report **+RESP:GTFLA**. 0 means “Disable”.
- ✧ <Report Sensor Data>: A numeric to indicate whether to report raw data from fuel sensor to the server with **+RESP:GTFSD**. Currently, only the UFSxxx supports the raw data report.
 - 0: Do not report raw data from fuel sensor.
 - 1: Report raw data from fuel sensor.

The acknowledgment report of the **AT+GTEFS** command:

➤ **+ACK:GTEFS,**

Example: +ACK:GTEFS,DC0100,135790246811220,,0008,20090214093254,11F0\$			
Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXFFFF, X ∈ {'A' – 'Z', '0' – '9'}	
Unique ID	15/12	IMEI/MUID	
Device Name	<=10	'0' – '9' 'a' – 'z' 'A' – 'Z' '-' '_'	
Serial Number	4	0000 – FFFF	
Send Time	14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

3.2.7.4. Fuel Sensor Calibration Table

This command is used to set the calibration table for fuel sensor.

➤ **AT+GTFSC=**

Example: AT+GTFSC=gv600mg,,0,2,1,,,3,250,0,10000,50,16000,100,,,,,,,,,FFFF\$			
Parameter	Length (Byte)	Range/Format	Default
Password	4~20	'0'~'9' 'a'~'z' 'A'~'Z'	gv600mg
Reserved			
Table ID	1	0 – 4	1
Sensor Type	1	0-2	2
Enable	1	0/1	0
Max. Tank Volume	<= 5	0 –10000	100
Reserved			
Num of Node	<= 2	0/2 – 11	0
Node 1 Value	<= 5	0~99999	
Node 1 Percentage	<= 2	0 – 100	
⋮			
Node N Value	<= 5	0~99999	
Node N Percentage	<= 2	0 – 100	
Reserved			
Reserved			
Reserved			
Reserved			
Reserved			
Reserved			
Reserved			
Serial Number	4	0000~FFFF	
Tail Character	1	\$	\$

✧ <Table ID>: The ID of the calibration table that is currently being set.

✧ <Sensor Type>: The sensor type for this table.

- 0: Reserved
- 1: Reserved
- 2: DUT-E
- 3: Reserved
- 4: UFSXXX

- 5: Reserved.
- 6: Reserved
- ✧ <Enable>: Enable or disable this table. If this table is enabled, the calculation of fuel level will be linearized.
- ✧ <Max. Tank Volume>: The maximum volume of tank. The unit is L.
- ✧ <Num of Node>: Number of the nodes in the table below.
- ✧ <Node N Value>: Value of this node.
- ✧ <Node N Percentage>: The corresponding percentage value of this node. This parameter must be in ascending order beginning with 0% and ending with 100%.

3.2.7.5. Upgrade Of Fuel Sensor

The command **AT+GTUFS** is used to upgrade the firmware of UFSxxx fuel sensor over the air.

➤ AT+GTUFS=

Example: AT+GTUFS=gv600mg,3,30,0,,,http://220.178.67.210:8208/gv600mg/deltabin/csb_des_07_bu ild1116.bin,,,,,0001\$			
Parameter	Length (Byte)	Range/Format	Default
Password	4 – 20	'0' – '9' 'a' – 'z' 'A' – 'Z'	gv600mg
Max Retries	1	0 – 3	0
Download Timeout	2	10-30min	10
Protocol Type	1	0	0
Server User Name	<=20	'0-9', '_', 'a-z', 'A-Z'	
Server Password	<=20	'0-9', '_', 'a-z', 'A-Z'	
Server URL	100	Legal URL	
Reserved	0		
Reserved	0		
Reserved	0		
Reserved	0		
Serial Number	4	0000 – FFFF	
Tail Character	1	\$	\$

- ✧ <Max Retries>: It specifies the maximum number of retries after the first downloading fails.
- ✧ <Download Timeout>: If downloading is not finished within this time, it will be regarded that the downloading failed.
- ✧ <Protocol Type>: The protocol used to download the package.
 - 0: HTTP. Only HTTP is supported now.
- ✧ <Server User Name>: If the file server uses authentication, the user name is specified here.

- ✧ <Server Password>: If the file server uses authentication, the password is specified here.
- ✧ <Server URL>: It specifies the URL to download the package.

The acknowledgment report of the **AT+GTUFS** command:

➤ **+ACK: GTUFS,**

Example: +ACK:GTUFS,DC0100,135790246811220,,0018,20090214093254,11F0\$			
Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXFFFF, X ∈ {'A' – 'Z', '0' – '9'}	
Unique ID	15/12	IMEI/MUID	
Device Name	<=20	'0' – '9' 'a' – 'z' 'A' – 'Z' '-' '_'	
Serial Number	4	0000 – FFFF	
Send Time	14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

3.2.8. Other Settings

3.2.8.1. Real Time Operation

The command **AT+GTRTO** is used to retrieve information from the terminal or control the terminal to execute certain actions.

➤ **AT+GTRTO=**

Example: AT+GTRTO=gv600mg,A,,,,,,0012\$				
SN	Parameter	Length (Byte)	Range/Format	Default
1	Password	4 – 7	'0' – '9' 'a' – 'z' 'A' – 'Z'	gv600mg
2	Sub Command	2	0 – F 10-16	
3	AT Command Configuration Mask	3 16	"SRI" 0000000000000000 – FFFFFFFFFFFFFFFF	
4	Output direction	1	0-3	
5	Reserved	0		
6	Reserved	0		
7	Sub Command Parameter	1	0--2	

	Serial Number	4	0000 – FFFF	
	Tail Character	1	\$	\$

✧ <Sub Command>:

- 0: **GPS**. Get the GPS related information via message **+RESP: GTGPS**.
- 1: **RTL**. Request the terminal to report its current position immediately via message **+RESP: GTRTL**.
- 2: **READ**. Get the current configuration of the terminal via message **+RESP: GTALM** or **+RESP: GTALS** or **+RESP: GTALC**.
- 3: **REBOOT**. Reboot the terminal.
- 4: **RESET**. Reset all parameters to factory setting.
- 5: **PWROFF**. Power off the device.
- 6: **CID**. Get the ICCID of the SIM card which is being used by the terminal via message **+RESP:GTCID**.
- 7: **CSQ**. Get the current received signal strength of the terminal via message **+RESP: GTCSQ**.
- 8: **VER**. Get the version information of the device via message **+RESP: GTVER**.
- 9: **BAT**. Get the battery level and adapter status of the terminal via message **+RESP: GTBAT**.
- A: **IOS**. Get status of all the IO ports via message **+RESP: GTIOS**.
- B: **TMZ**. Get the time zone settings via message **+RESP:GTTMZ**.
- C: **GIR**. Get cell information via message **+RESP:GTGSM**.
- D: **AIF**. Get APN, ICCID, base station ID, RSSI, cell ID, and IP via **+RESP:GTAIF**.
- E: **GSV**. Request the device to report the GPS fix level.
- F: **INF**. Read the device information report function. The corresponding information will be sent via the message **+RESP:GTINF**.
- 10-13: Reserved
- 14: **DELBUF**. Delete all the buffered reports.
- 30: **RSS**. Get the real time information of the sensors via message **+RESP:GTRSS**.

✧ <AT Command/Configuration Mask>:

- <AT Command>: To get a single AT command's configuration when <Sub Command> is set to 2, follow the format in the following example. For example, to get the configuration of AT+GTFRI, please set AT+GTRTO=gv600mg,2,FRI,,,,,0015\$, and get it via **+RESP:GTALS**.
- <Configuration Mask>: If <Sub Command> is set to 2, the configuration information of the specified <Configuration Mask> can be obtained via the message **+RESP:GTALC**. The Configuration Mask must be 16 bytes. If it's less than 16 bytes, '0' will be added in the high bytes of the Configuration Mask.

✧ <Sub Command Parameter>: This parameter is used for part of the sub commands. This field cannot be empty for the sub-commands listed below.

For the sub command RESET (4):

- 0: Light. Reset all configuration parameters, except:
- (1) Reserved.

(2) Network-related configuration (AT+GTBSI/AT+GTSRI).

(3) Device password (AT+GTCFG).

(4) Time Zone (AT+GTTMA).

- 1: Heavy. Reset all configuration parameters.

Note: AT+GTPIN will not be reset.

Configuration Mask Table:

Bit	Item to Mask

Tail Character	1	\$	\$

✧ **<Sub Command>**: A string to indicate the sub command of **AT+GTRTO**.

3.2.8.2. Data transfer

The command **AT+GTDAT** is used to transfer data between the backend server and the equipment connected to the second serial port of the device. Data to the backend server is wrapped into message **+RESP:GTDAT** and sent to the backend server while data to the equipment is directly output to the second serial port without the @Tracker protocol stuffing. Transparent transfer is used to transmit the data to the device.

Before using this command, you should use **AT+GTMUT** command to set the correct parameters of the second serial port first.

➤ **AT+GTDAT=****Example:**

AT+GTDAT=gv600mg,0,,data to the backend server,,,,,0014\$

AT+GTDAT=gv600mg,1,,data to the serial port,,,,,0014\$

AT+GTDAT=gv600mg,2,,data to the backend server,,,,,0014\$

AT+GTDAT=gv600mg,3,,data to the serial port,,,,,0014\$

SN	Parameter	Length (Byte)	Range/Format	Default
1	Password	4 – 7	'0' – '9' 'a' – 'z' 'A' – 'Z'	gv600mg
2	Command Type	1	0 1 2 3	
3	Reserved	0		
4	Data Type	<=1280	ASCII Code	
5	Need Ack	1	0 1	
6	Reserved	0		
7	Reserved	0		
8	Reserved	0		
	Serial Number	4	0000 – FFFF	
	Tail Character	1	\$	\$

- ✧ <Command Type>: To indicate in which way to send the data.
 - 0: Means to send message to the backend server with **+RESP:GTDAT (Short Format)**.
 - 1: Means to send the pure data directly to the serial port.
 - 2: Means to send message to the backend server with **+RESP:GTDAT (Long Format)**.
 - 3: Means to send the pure data directly to the serial port without CRLF.
- ✧ <Data Type>: Data to be transferred between the backend server and the equipment connected to the second serial port of the device. The max length for main serial port (MUT) is 1280.
- ✧ <Need Ack>: Need report **+ACK:GTDAT** or not.
 - 0: Do not need Ack report.
 - 1: Need report Ack.

The acknowledgment message of **AT+GTDAT** command:

➤ **+ACK:GTDAT,****Example:**

+ACK:GTDAT,DC0100,862170019025640,,0014,20140511093254,11F0\$

Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXXFFF, X ∈ {'A' –	

		'Z', '0' – '9'}	
Unique ID	15/12	IMEI/MUID	
Device Name	<=20	'0' – '9' 'a' – 'z' 'A' – 'Z' '-' ' ' '_'	
Serial Number	4	0000 – FFFF	
Send Time	14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

3.2.8.3. White Number List Configuration

The **AT+GTWLT** command is used to set white number list.

➤ **AT+GTWLT=**

Example: AT+GTWLT=gv600mg,1,1,2,13813888888,13913999999,,,,,000C\$				
SN	Parameter	Length (Byte)	Range/Format	Default
1	Password	4 – 7	'0' – '9' 'a' – 'z' 'A' – 'Z'	gv600mg
2	Number Filter	1	0 1 2	1
3	Phone Number Start	1	1-10	1
4	Phone Number End	1	1-10	1
5	White Number List	<=20*10		
6	Reserved	0		
7	Reserved	0		
8	Reserved	0		
9	Reserved	0		
	Serial Number	4	0000 – FFFF	
	Tail Character	1	\$	\$

✧ <Number Filter>: A numeric to indicate whether to filter the original number according to <White Number List> and <Direct Number List> before it sends Google link SMS to the original number.

- 0: Do not return SMS to original number, ignore the received position request message no matter the original number is in the <White Number List> or <Direct Number

List> or not.

- 1: Do not filter the original number. It will return SMS to the original number as long as position request message is received via SMS.
 - 2: Filter the original number. If the original number isn't in <White Number List> or <Direct Number List>, it won't return a SMS to the incoming number even if the device receives position request message via SMS
- ✧ <Phone Number Start>: A numeric to indicate the first index of the white number to be input. For example, if it is 1, it will update the white number list from the 1st one.
- ✧ <Phone Number End>: A numeric to indicate the last index of the white number to be input. For example, if it is 2, it will update the white number list until the 2nd one.
- ✧ <White Number List>: A phone number list including multiple phone numbers. And two neighboring phone numbers are separated with ",". The number of the phone number in the list depends on the parameters <Phone Number Start> and <Phone Number End>. For example, if <Phone Number Start> is 1 and <Phone Number End> is 2, the <White Number List> should include 2 phone numbers and the two numbers are separated with ",".

The acknowledgment message of **AT+GTWLT** command:

➤ **+ACK:GTWLT,**

Example: +ACK:GTWLT,DC0100,862170019025640,,0015,20140511093254,11F0\$			
Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXFFFF, X ∈ {'A' – 'Z', '0' – '9'}	
Unique ID	15/12	IMEI/MUID	
Device Name	<=20	'0' – '9', 'a' – 'z', 'A' – 'Z', '-', '_'	
Serial Number	4	0000 – FFFF	
Send Time	14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

3.2.8.4. Command String Storage

The **AT+GTCMD** command is used to store the commands used by the command **AT+GTUDF**.

➤ **AT+GTCMD=**

Example: AT+GTCMD=gv600mg,1,1,AT+GTRTO=gv600mg,0,,,,,000B\$,,,,,0005\$			
Parameter	Length (Byte)	Range/Format	Default
Password	4 – 6	'0' – '9', 'a' – 'z', 'A' – 'Z'	gv600mg
Mode	1	0-1	0

Stored cmd ID	<=2	0 – 31	
Command String	200	AT command	
Reserved	0		
Reserved	0		
Reserved	0		
Reserved	0		
Serial Number	4	0000 – FFFF	
Tail Character	1	\$	\$

- ✧ <Mode>: The working mode for storing command string.
 - 0: Delete the stored command.
 - 1: Add the stored command.
- ✧ <Stored cmd ID>: A numeral to identify the stored command.
- ✧ <Command String>: The content of the stored command.

The acknowledgement message of **AT+GTCMD** command:

➤ **+ACK:GTCMD**

Example: +ACK:GTCMD,DC0100,862170019025640,,0015,20140511093254,11F0\$			
Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXFFFF, X ∈ {'A' – 'Z', '0' – '9'}	
Unique ID	15/12	IMEI/MUID	
Device Name	<=20	'0' – '9', 'a' – 'z', 'A' – 'Z', '-', '_', ' '	
Serial Number	4	0000 – FFFF	
Send Time	14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

3.2.8.5. User Defined Function

The **AT+GTUDF** command is used to bind input events and the stored commands. The input events will trigger the corresponding stored commands.

➤ **AT+GTUDF=**

Example: AT+GTUDF=gv600mg,2,1,0000000000000082,30,FFFF,00000,0000001F,1,00000,00000,,,FFFF \$			
Parameter	Length (Byte)	Range/Format	Default
Password	4 – 6	'0' – '9', 'a' – 'z', 'A' – 'Z'	gv600mg
Mode	1	0-2	0

Group ID	<=2	0 – 31	
Input ID Mask	<=16	0-FFFFFFFFFFFFFFFF	
Debounce Time	<=5	0-86400(s)	0
Inzizo Mask	<=5	00000-FFFFF	0
Outzizo Mask	<=5	00000-FFFFF	0
Stocmd ID Mask	<=8	0-FFFFFFF	
Stocmd Ack	1	0 1	0
Inpeo Mask	<=5	00000-FFFFF	0
Outpeo Mask	<=5	00000-FFFFF	0
Reserved			
Reserved			
Serial Number	4	0000 – FFFF	
Tail Character	1	\$	\$

- ✧ <Mode>: The working mode of the user defined function.
 - 0: Disable the group.
 - 1: Enable the group.
 - 2: Delete the group.
- ✧ <Group ID>: A numeral to identify the group of input events and stored commands to be executed.
- ✧ <Input ID Mask>: The bitwise mask to indicate the input events included in the group.
 - Bit 0 (00000001): Select ID1
 - Bit 1 (00000002): Select ID2
 - Bit 2 (00000004): Select ID3
 - Bit 3 (00000008): Select ID4
 - For example:
 - Bit (00000003): Select ID1, ID2
 - Bit (00000017): Select ID1, ID2, ID3, ID5

ID	Bit	Item to Mask
1	Bit 0	Power on finished
2	Bit 1	Ignition on
3	Bit 2	Ignition off
4	Bit 3	The GPRS network is attached
5	Bit 4	The GPRS network is not attached
6	Bit 5	The GSM network registered
7	Bit 6	The GSM network not registered
8	Bit 7	Network roaming
9	Bit 8	Network non roaming
10	Bit 9	SIM card is locked
11	Bit 10	GPS is turned on
12	Bit 11	GPS is turned off

Note:

Maximum 5 stored commands in a group will be executed.

The acknowledgement message of **AT+GTUDF** command:

➤ **+ACK:GTUDF**

Example: +ACK:GTUDF,DC0100,862170019025640,,0015,20140511093254,11F0\$			
Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXXFFF, X ∈ {'A' – 'Z', '0' – '9'}	
Unique ID	15/12	IMEI/MUID	
Device Name	<=20	'0' – '9' 'a' – 'z' 'A' – 'Z' '-' '_'	
Serial Number	4	0000 – FFFF	
Send Time	14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

3.2.8.6. Google Link SMS Configuration

The **AT+GTGLM** command is used to configure whether to send SMS with Google link for SOS and GEO event.

➤ **AT+GTGLM=**

Example: AT+GTGLM=gv600mg,1,1,2,13813888888,13913999999,,,,,000D\$				
SN	Parameter	Length (Byte)	Range/Format	Default
1	Password	4 – 7	'0' – '9' 'a' – 'z' 'A' – 'Z'	gv600mg
2	Google Mode	1	0 1	0
3	Phone Number Start	1	1-3	
4	Phone Number End	1	1-3	
5	Direct Number List	<=20*3		
6	Reserved	0		
7	Reserved	0		

8	Reserved	0		
9	Reserved	0		
	Serial Number	4	0000 – FFFF	
	Tail Character	1	\$	\$

□

- ✧ <Google Mode>: A numeric to indicate whether to send a SMS with Google link to the number in <Direct Number List> for SOS and GEO events.
 - 0: Do not send a SMS with Google link to the number in the <Direct Number List> for SOS and GEO events.
 - 1: Send a SMS with Google link to the number in the <Direct Number List> for SOS and GEO events and include the terminal name in the Google hyperlink.
- ✧ <Phone Number Start>: A numeric to indicate the first index of the white number to be input. For example, if it is 1, it will update the white number list from the 1st one. If it is empty, it should not include the number of <Direct Number List>.
- ✧ <Phone Number End>: A numeric to indicate the last index of the white number to be input. For example, if it is 2, it will update the white Number list until the 2nd one. If it is empty, it should not include the number of <Direct Number List>.
- ✧ <Direct Number List>: A phone number list. It could include several phone numbers. And two neighboring phone numbers are separated with ",". The number of the phone number in the list is defined by the parameters <Phone Number Start> and <Phone Number End>. For example, if <Phone Number Start> is 1 and <Phone Number End> is 2, the <White Number List> should include 2 phone numbers and the two numbers are separated with ",".

The acknowledgment message of **AT+ GTGLM** command:

➤ **+ACK: GTGLM,**

Example:			
+ACK:GTGLM,DC0100,862170019025640,,0015,20140511093254,11F0\$			
Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXFFFF, X ∈ {'A' – 'Z', '0' – '9'}	
Unique ID	15/12	IMEI/MUID	
Device Name	<=20	'0' – '9' 'a' – 'z' 'A' – 'Z' '-' '_'	
Serial Number	4	0000 – FFFF	
Send Time	14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

3.2.8.7. Hour Meter Counter

The command **AT+GTHMC** is used to measure accumulative ignition time. To use this command, the ignition signal must be connected to the device. *<Hour Meter Counter>* will be included in **+RESP:GTFRI**, **+RESP:GTIGN** or **+RESP:GTIGF** reports.

➤ AT+GTHMC=

Example: AT+GTHMC=gv600mg,1,12345:12:34,,,,,,,,,0015\$				
SN	Parameter	Length (Byte)	Range/Format	Default
1	Password	4 – 7	'0' – '9' 'a' – 'z' 'A' – 'Z'	gv600mg
2	Hour Meter Enable	1	0 1	0
3	Initial Hour Meter Count	11	00000:00:00-99999:00:00	00000:00:00
4	Reserved	0		
5	Reserved	0		
6	Reserved	0		
7	Reserved	0		
8	Reserved	0		
9	Reserved	0		
10	Reserved	0		
11	Reserved	0		
	Serial Number	4	0000 – FFFF	
	Tail Character	1	\$	\$

- ✧ *<Hour Meter Enable>*: Enable or disable hour meter counter function. If hour meter counter function is enabled, hour meter count will be increased when the device is in ignition.
 - 0: Disable hour meter counter function
 - 1: Enable hour meter counter function
- ✧ *<Initial Hour Meter Count>*: Initial value of hour meter. It is formatted with 5 hour digits and 2 minute digits and 2 second digits and ranges from 00000:00:00–99999:00:00. The *<Hour Meter Count>* in **+RESP:GTFRI**, **+RESP:GTIGN**/**+RESP:GTVGN** or **+RESP:GTIGF**/**+RESP:GTVGF** will be increased based on the value of first-time ignition on.

The acknowledgment message of **AT+GTHMC** command:

➤ +ACK:GTHMC,

Example:

+ACK:GTHMC,DC0100,862170019025640,,0015,20140511093254,11F0\$

Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXFFFF, X ∈ {'A' – 'Z', '0' – '9'}	
Unique ID	15/12	IMEI/MUID	
Device Name	<=20	'0' – '9' 'a' – 'z' 'A' – 'Z' '-' '_'	
Serial Number	4	0000 – FFFF	
Send Time	14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

3.2.8.8. GPS-Assisted Motion Measurement

The command **AT+GTGAM** is used for assisting in measuring motion with GPS if the sensor detects motionless state while the vehicle is ignition on.

➤ **AT+GTGAM=**

Example:				
AT+GTGAM=gv600mg,1,1,25,10,60,,,,,FFFF\$				
SN	Parameter	Length (Byte)	Range/Format	Default
1	Password	4 – 20	'0' – '9' 'a' – 'z' 'A' – 'Z'	gv600mg
2	Mode	1	0 1	1
3	Speed Mode	1	0 1	1
4	Motion Speed Threshold	<=2	5-50km/h	25
5	Motion Cumulative Time	<=3	10-100s	10
6	Motionless Cumulative Time	<=3	10-250s	60
7	GNSS Fix Failure Timeout	<=4	5-1800s	60
8	Reserved	0		
9	Reserved	0		
10	Reserved	0		
11	Reserved	0		
	Serial Number	4	0000 – FFFF	
	Tail Character	1	\$	\$

✧ **<Mode>**: The working mode of the GPS-assisted motion measurement function.

- 0: Disable this function.
- 1: Enable this function.
- ✧ <Speed Mode>: It combines with GPS speed to measure the status of movement.
 - 0: Disable the function.
 - 1: Enable the function.
- ✧ <Motion Speed Threshold>: The speed threshold combined with GPS speed to measure the status of movement.
- ✧ <Motion Cumulative Time>: If the average speed in <Motion Cumulative Time> is higher than <Motion Speed Threshold>, the device is considered to be in motion status.
- ✧ <Motionless Cumulative Time>: If the average speed in <Motionless Cumulative Time> is lower than <Motion Speed Threshold>, the device is considered to be in motionless status.
- ✧ <GPS Fix Failure Timeout>: If the time for GPS no fix is more than <GPS Fix Failure Timeout>, the device will update motion status by motion sensor again.

The acknowledgment message of the **AT+GTGAM** command:

➤ **+ACK:GTGAM,**

Example: +ACK:GTGAM,DC0100,135790246811220,,1,0006,20090214093254,11F0\$			
Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXFFFF, X∈{'A' – 'Z', '0' – '9'}	
Unique ID	15/12	IMEI/MUID	
Device Name	<=20	'0' – '9' 'a' – 'z' 'A' – 'Z'	
Serial Number	4	0000 – FFFF	
Send Time	14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

3.2.8.9. Update Configuration Over the Air

The AT+GTUPC command is used to send control command.

➤ **AT+GTUPC=**

Example: AT+GTUPC=gv600mg,0,10,0,0,168,http://www.queclink.com/configure.ini,1,,,,,,,,,0001\$				
SN	Parameter	Length (Byte)	Range/Format	Default
1	Password	4 – 20	'0' – '9', 'a' – 'z', 'A' – 'Z'	gv600mg

13	Reserved	0		
14	Download User Name	<=6	'0'-'9', 'a'-'z', 'A'-'Z'	
15	Download Password	<=6	'0'-'9', 'a'-'z', 'A'-'Z'	
	Serial Number	4	0000 – FFFF	
	Tail Character	1	\$	\$

- ✧ <Password>: The valid characters of password include '0'-'9', 'a'-'z', 'A'-'Z'. The default value is "gv600mg".
- ✧ <Max Download Retries>: Specifies the maximum times of retrying to download the configuration file upon downloading failure.
- ✧ <Download Timeout>: If downloading is not finished within this time, it will be regarded that the downloading failed.
- ✧ <Download Protocol>: The protocol used to download the file. Only HTTP is supported now. Set it to 0.
- ✧ <Report Enable>: A numeric to indicate whether to send the message **+RESP:GTUPC** to indicate the configuration was updated over the air.
 - 0: Do not send the message +RESP:GTUPC
 - 1: Send the message +RESP:GTUPC
- ✧ <Update Interval>: The time interval (hour) for updating the configuration over the air.
- ✧ <Download URL>: Specify the URL to download the configuration file. If the URL ends with "/", it means this is just a path without any file. <imei>.ini will be added as the file name at the end of URL.
- ✧ <Mode>: A numeric to indicate the working mode of downloading configuration over the air
 - 0: Disable this function.
 - 1: Enable this function
- ✧ <Download User Name>: If the file server uses authentication, specify the user name here.
- ✧ <Download Password>: If the file server uses authentication, specify the password here.

The acknowledgement message of **AT+GTUPC** command report is reported as Location report.

Notice:

If the <Download URL> ends with “/”, it means the URL is a path without file name. <imie>.ini will be added as the file name at the end of URL. If it is larger than 100, an error will be reported.

The acknowledgment message of **AT+GTUPC** command:

➤ **+ACK:GTUPC,**

Example: +ACK:GTUPC,DC0100,862170019025640,,001D,20140511093254,11F0\$			
Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXXFFF, X ∈ {'A' – 'Z', '0' – '9'}	
Unique ID	15/12	IMEI/MUID	
Device Name	<=20	'0' – '9' 'a' – 'z' 'A' – 'Z'	
Serial Number	4	0000 – FFFF	
Send Time	14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

3.2.8.10. Input Expansion

The command **AT+GTIEX** is used to configure the External Bluetooth input accessories. All these inputs are customizable. If the logic status is changed on one of Bluetooth input accessories, the device will report the message **+RESP:GTDIS** to the backend server.

➤ **AT+GTIEX=**

Example: AT+GTIEX=gv600mg,0,0,1,5,,,,,,FFFF\$			
Parameter	Length (Byte)	Range/Format	Default
Password	4 – 6	'0' – '9' 'a' – 'z' 'A' – 'Z'	gv600mg

Serial Number	4	0000 – FFFF	
Send Time	14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

3.2.8.13. SMS Request Position

This command can only be sent via SMS. Device will send SMS message with Google maps hyperlink and the current position or send message **+RESP:GTLBC** immediately.

Command Format	get position
Example	get position

Get position: it's a command string to query current position.

3.3. Reports

This section defines the formats of the messages. Due to the max length of SMS message is 160 bytes, it is recommended to set the *<Report Composition Mask>* in **AT+GTCFG** properly to limit the length of the report, otherwise the report will be truncated to fit the length of SMS message.

3.3.1. Position Related Reports

➤ **+RESP:GTTOW,**

If the tow alarm is enabled by the command **AT+GTTOW**, the device will send the message **+RESP:GTTOW** to the backend server when the motion sensor detects towing.

➤ **+RESP:GTDIS,**

If the status of digital inputs is detected being changed, the device will send the message **+RESP:GTDIS** to the backend server.

➤ **+RESP:GTIOB,**

If the IO combination is set and the corresponding condition appears, the device will send the message **+RESP:GTIOB** to the backend server.

➤ **+RESP:GTSPD,**

If the speed alarm is enabled, the device will send the message **+RESP:GTSPD** to the backend server when the speed of the device is within the alarm range.

➤ **+RESP:GTSOS,**

If the SOS Alarm is enabled, the device will send the message **+RESP:GTSOS** to the backend server when the corresponding digital input port triggers SOS.

➤ **+RESP:GTRTL,**

After the device receives the command **AT+GTRTO**, the GPS starts to get the current position and then send the message **+RESP:GTRTL** to the backend server.

➤ **+RESP:GTPNL,**

Power on location

➤ **+RESP:GTD0G,**

The watchdog rebooting message

➤ **+RESP:GTIGL,**

The location message for ignition on and ignition off

All of the above messages have the same format as shown below.

Example:

+RESP:GTTOW,DC0100,862170019025640,,,10,,1,4.3,92,70.0,121.354335,31.222073,20140511093254,0460,0003,36100010,014B,00,2000.0,20140511093254,11F0\$

✧ **<Report ID/Report Type>**: The report ID and the type of the report type in hex format. 4 high bits mean report ID and 4 low bits mean report type.

Report ID has different meanings in different messages as below.

- The ID of digital input port which triggers the message **+RESP:GTDIS** and **+RESP:GTSOS**. The range is 1 - 4. Specifically, ID 5 of the **+RESP:GTDIS** refers to the WBC300 extended input.
- The ID of the bound IO which triggers the message **+RESP:GTIOB**. The range is 0 - 3.
- The ID of the digital input port which triggers the reboot message **+RESP:GTDOG**. The valid value is 1 - 4.

For the rest of the messages, it will always be 0.

Meanings of different report type in different messages are as below:

- In the **+RESP:GTDIS** message generated by the digital input
 - 0: The current logical status of the input port is disabled status.
 - 1: The current logical status of the input is enabled status.
- In the **+RESP:GTIOB** message generated by bound IO
 - 0: The current logical status of the bound IO does not meet the alarm condition.
 - 1: The current logical status of the bound IO meets the alarm condition.
- In the message of speed alarm **+RESP:GTSPD**
 - 0: Outside the predefined speed range.
 - 1: Inside the predefined speed range.
- In the message of Software Protocol Watchdog reboot message **+RESP:GTDOG**
 - 1: Reboot message for time based working mode
 - 2: Reboot message for ignition on working mode
 - 3: Reboot message for input triggered reboot
 - 4: Reboot message for network watchdog.
 - 5: Reboot message for no activation watchdog.
 - 6: Reboot message for network data retrying to reboot watchdog.
- In the message of ignition on and ignition off message **+RESP:GTIGL**
 - 0: The engine is ignition on.
 - 1: The engine is ignition off.

For the rest of the messages, it will always be 0.

- ✧ **<Number>**: The number of the GPS positions included in the message. Generally, it equals to 1.
- ✧ **<GPS Accuracy>**: The HDOP defined in NMEA0183 (The National Marine Electronics Association (NMEA) is a non-profit association of manufacturers, distributors, dealers, educational institutions, and others interested in peripheral marine electronics occupations. The NMEA 0183 standard defines an electrical interface and data protocol for communications between marine instrumentation.). The range of the value is 0 – 50. Here 0 means no GPS fix.
- ✧ **<Speed>**: The current speed. Unit: km/h
- ✧ **<Azimuth>**: The azimuth of the GPS fixing.
- ✧ **<Altitude>**: The height above the sea level.
- ✧ **<Longitude>**: The longitude of the current position.
- ✧ **<Latitude>**: The latitude of the current position.
- ✧ **<GPS UTC Time>**: The UTC time from the GPS chip.
- ✧ **<MCC>**: Mobile Country Code. It is 3-digit in length and ranges from 000 to 999. If bit 3 is not set to 1 in field **<Report Composition Mask>** within **AT+GTCFG**, the length of this field is 0 in ASCII format message.
- ✧ **<MNC>**: Mobile Network Code. It is 3-digit in length and ranges from 000 to 999. If bit 3 is not set to 1 in field **<Report Composition Mask>** within **AT+GTCFG**, the length of this field is 0 in ASCII format message.
- ✧ **<LAC>**: Location Area Code in hex format.
- ✧ **<Cell ID>**: Cell ID in hex format.
- ✧ **<Mileage>**: The current total mileage or the current tow mileage.

➤ **+RESP:GTFRI,**

If fixed report is enabled, the device will send the message **+RESP:GTFRI** to the backend server according to the working mode.

Example: +RESP:GTFRI,DC0100,862170019025640,,,00,,1,4.3,92,70.0,121.354335,31.222073,20140511093254,0460,0003,36100010,014B,00,2000.0,12345:12:34,,,80,210100,,,,20140511093254,11F0\$

Tail Character	1	\$	\$

✧ **<External Power VCC>**: The voltage of the external power supply. Use command **AT+GTEPS** to decide whether to send the external power supply voltage periodically with fixed report or not. If not, this field will be empty.

✧ **<Report ID/Report Type>**: Indicate the working mode of the fixed report and the type of the message.

Report ID has six meanings as below.

- 1: Fixed timing report.
- 2: Fixed distance report.
- 3: Fixed mileage report.
- 4: Fixed timing and mileage report.
- 5: Fixed timing or mileage report.
- 6: GSM DEEP mode fixed timing report

Report type has six meanings as below.

- 0: The normal fixed report.
- 1: Corner report which indicates that the device just turns around a corner.
- 2: FRI report frequency change which indicates that the terminal enters into Geo-Fence status or known/unknown roaming status.
- 3: Corner report when FRI report frequency changed.
- 4: Mileage report when fixed report is mode 5.
- 5: Reserved.
- 6: Mileage report when fixed report is mode 5 and FFC works.

✧ **<Number>**: The number of the GPS positions included in the message. Generally, it equals to 1.

✧ **<Hour Meter Count>**: If hour meter counter function is enabled by the command **AT+GTHMC**, total hours counted when engine is on will be reported in this field. It is formatted with 5 hour digits and 2 minute digits and 2 second digits and ranges from 00000:00:00–99999:00:00. If the function is disabled, this field will be empty.

✧ **<Analog1 Input 1>**: The voltage of the analog input 1 or the fuel level measured from the fuel sensor connected to the corresponding analog input port. Use command **AT+GTAIS** to decide whether to send the external voltage of the analog input 1 or 2 or the fuel level with the format of “FXX” periodically with FRI report or not. If not, this field will be empty.

✧ **<Backup Battery Percentage>**: The current volume of the backup battery in percentage.

- ✧ **<Device Status>**: The state of the device. The left two bits indicate the current motion state of the device, the middle two bits indicate the input ports status and the right two bits indicate the output ports status.

The current motion state of the device:

- 16 (**Tow**): The device attached vehicle is ignition off and it is towed.
- 1A (**Fake Tow**): The device attached vehicle is ignition off and it might be towed.
- 11 (**Ignition Off Rest**): The device attached vehicle is ignition off and it is motionless.
- 12 (**Ignition Off Motion**): The device attached vehicle is ignition off and it has been moving before it is regarded as being towed.
- 21 (**Ignition On Rest**): The device attached vehicle is ignition on and it is motionless.
- 22 (**Ignition On Motion**): The device attached vehicle is ignition on and it is moving.
- 41 (**Sensor Rest**): The device attached vehicle is motionless without ignition signal detected.
- 42 (**Sensor Motion**): The device attached vehicle is moving without ignition signal detected.

The input ports status: A bitwise hex integer to represent the logical status of the digital input. From the lowest bit to the highest bit, each bit represents ignition detection and one of the digital inputs 1 – 4 respectively. For each bit, 0 means disable status, 1 means enable status.

The output ports status: A bitwise hex integer to represent the logical status of the digital output. From the lowest bit to the highest bit, each bit represents one of the digital outputs 1 – 4 respectively. For each bit, 0 means disable status, 1 means enable status.

- ✧ **<External Power VCC2>**: The voltage of the reserved external power supply. Use command AT+GTEPS to decide whether to send the external power supply voltage periodically with FRI report or not. If not, this field will be empty.

➤ **+RESP:GTERI,**

If the **+RESP:GTERI** is enabled, the device will send the message **+RESP:GTERI** to the backend server instead of **+RESP:GTFRI**.

Example:

/*1wire bus connect no device*/

Count Number	4	0000 – FFFF		
Tail Character	1	\$		\$

- ✧ *<1-Wire Device Number>*: The number of 1-wire device connected to gv600mg. If it is 0, the following fields *<1-wire Device ID>*, *<1-wire Device Type>*, *<1-wire Device Data>* will not display. If there are more than one 1-wire devices connected, the following fields *<1-wire Device ID>*, *<1-wire Device Type>*, *<1-wire Device Data>* will repeat to show the information of all connected 1-wire devices. If Bit 1 of *<ERI Mask>* in **AT+GTFRI** is enabled, the part *<1-Wire Data>* will display, otherwise, the part *<1-Wire Data>* will not display.
- ✧ *<1-Wire Device ID>*: Means the 1-Wire device ID read from the device. If the bit 1 is not set to 1 in field *<ERI Mask>* within **AT+GTFRI**, the length of this field is 0 in ASCII format message.
- ✧ *<1-Wire Device TYPE>*: Means the 1-Wire device type. If the bit 1 is not set to 1 in field *<ERI Mask>* within **AT+GTFRI**, the length of this field is 0 in ASCII format message.
 - 1: Temperature sensor.
- ✧ *<1-Wire Device DATA>*: Means the data read from the 1-Wire devices. If the value of *<1-Wire Device Type>* is the temperature sensor, this indicates the temperature value. To convert the value of the two bytes in hex to decimal, multiply it by 0.0625 to get the temperature value in Celsius degrees. If the first 5 bits of the high byte are 1, the temperature value is below zero Celsius degrees and the value is represented in two's complement format. To obtain the temperature in decimal, plus the hexadecimal data by 1 and then multiply it by 0.0625 to get the value in Celsius degrees.
- ✧ *<Bluetooth Accessory Number>*: It indicates the number of accessories connected with the device.
- ✧ *<Index>*: There are two meaning for *<Index>*.
 - The index of Bluetooth accessory defined in **AT+GTBAS** which triggers the **+RESP:GTBAA** message.
 - 0xFF for WKF300.
- ✧ *<Accessory Type>*: The type of the Bluetooth accessory which is defined in the *<Index>*. The following is supported now:
 - 0: No Bluetooth accessory.
 - 1: Reserved.
 - 2: Beacon temperature sensor.
 - 3: BLE beacon ID device.
- ✧ *<Accessory Model>*: The model of the Bluetooth accessory which is defined in **AT+GTBAS**.
- ✧ *<Raw Data Length>*: It indicates the length of *<Raw Data>*.
- ✧ *<Raw Data>*: The data is read from Bluetooth accessory. It varies depending on *<Accessory Type>* and *<Accessory Model>*.
- ✧ *<Accessory Name>*: The name of the Bluetooth accessory. It ends with 0x00.
- ✧ *<Accessory MAC>*: The MAC address of the Bluetooth accessory.

- ✧ <Accessory Connection Status>: It indicates the connection status of Bluetooth accessory.
 - 0: Disconnected.
 - 1: Connected.
- ✧ <Accessory Voltage>: The voltage of Bluetooth accessory.
- ✧ <Accessory Temperature>: Temperature data of Bluetooth accessory.
- ✧ <Accessory Humidity>: It indicates the humidity measured by the Bluetooth accessory.
- ✧ <Accessory Output status>: The status of Bluetooth accessory output.
- ✧ <Accessory Digital Input status>: The status of Bluetooth accessory digital input. Each bit indicates the status of one output. For example, 0X01 indicates that Output ID of 5 is high and Output ID 6 is low.
- ✧ <Accessory Analog Input voltage>: The status of Bluetooth accessory analog input voltage.

Note: the key word (optional) means the item is controlled by the parameter <ERI Mask>.

➤ **+RESP:GTEPS,**

If the external power supply monitoring is enabled by the command **AT+GTEPS**, the device will send the message **+RESP:GTEPS** to the backend server when the voltage of the external power supply enters the alarm range.

➤ **+RESP:GTAIS,**

If the analog input alarm is enabled by the command **AT+GTAIS**, the device will send the message **+RESP:GTAIS** to the backend server when analog input voltage enters the alarm range.

All of the above messages have the same format as shown below.

Example: +RESP:GTEPS,DC0100,862170019025640,,13500,00,,1,4.3,92,70.0,121.354335,31.222073,20140511093254,0460,0003,36100010,014B,00,2000.0,20140511093254,11F0\$ +RESP:GTAIS,DC0100,862170019025640,,1980,11,,1,4.3,92,70.0,121.354335,31.222073,20140511093254,0460,0003,36100010,014B,00,2000.0,20140511093254,11F0\$			
Parameter	Length (Byte)	Range/Format	Default

Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

✧ <External Power/Analog Input VCC>: The value of the external power supply voltage or the analog input voltage. When the voltage of the analog input meets the alarm condition set by command **AT+GTEPS** or **AT+GTAIS**, the device will send the current analog input voltage along with **+RESP:GTEPS** or **+RESP:GTAIS** message to the backend server

✧ <Report ID/Report Type>: The report ID and the type of the report type in hex format. 4 high bits mean report ID and 4 low bits means report type.

Report ID has different meanings in these two messages.

- The ID of analog input port which triggers message **+RESP:GTEPS**. The value is 1-2.
- The ID of analog input port which triggers message **+RESP:GTAIS**. The range is 1 or 5.

Report type has two meanings as below:

- 0: Outside of the predefined range.
- 1: Inside of the predefined range.

✧ <Number>: The number of the GPS positions included in the message. Generally, it equals to 1.

➤ **+RESP:GTGIN**

➤ **+RESP:GTGOT**

If Geo-Fence is configured and enabled, the device will send the message **+RESP:GTGIN** to the backend server according to the settings when the device enters the Geo-Fence and will send **RESP:GTGOT** when the device exits the Geo-Fence.

Example:

+RESP:GTGIN,DC0100,862170019025640,,,,1,,,,,3,0.7,0,58.9,117.201251,31.833126,20140511

- ✧ <State>: The current motion state of the device.
 - 16 (**Tow**): The device attached vehicle is ignition off and it is towed.
 - 1A (**Fake Tow**): The device attached vehicle is ignition off and it might be towed.
 - 11 (**Ignition Off Rest**): The device attached vehicle is ignition off and it is motionless.
 - 12 (**Ignition Off Motion**): The device attached vehicle is ignition off and it has been moving before it is regarded as being towed.
 - 21 (**Ignition On Rest**): The device attached vehicle is ignition on and it is motionless.
 - 22 (**Ignition On Motion**): The device attached vehicle is ignition on and it is moving.
 - 41 (**Sensor Rest**): The device attached vehicle is motionless without ignition signal detected.
 - 42 (**Sensor Motion**): The device attached vehicle is moving without ignition signal detected.
- ✧ <CSQ RSSI>: The signal strength level.

CSQ RSSI	Signal Strength (dBm)
0	<-133
1	-111
2 – 30	-109 – -53
31	>-51
- ✧ <CSQ FER>: The quality of the network signal. The range is 0-7.
- ✧ <External Power Supply>: Whether the external power supply is connected.
 - 00: No External Power Supply connected
 - 01: External Power Supply VCC connected, VCC2 not connected.
 - 10: External Power Supply VCC2 connected, VCC not connected
 - 11: Two external power supplies connected.
- ✧ <External Power Supply VCC>: The voltage of the external power supply.
- ✧ <External Power Supply VCC2>: The voltage of the external power supply.
- ✧ <Backup Battery VCC>: The voltage of the backup battery. The value of this field is only valid when the external power is not connected.
- ✧ <Charging>: Whether the backup battery is being charged when the main power supply is connected.
 - 0: Not charging
 - 1: Charging
- ✧ <Last Fix UTC Time>: The UTC time of the latest successful GPS fixing.
- ✧ <IO Mode>: The working mode of IO1-IO4 on the connector.
- ✧ <Analog Input VCC1>: The voltage of the analog input 1.
- ✧ <Digital Input>: A bitwise hex integer to represent the logical status of the digital input. From the lowest bit to the highest bit, each bit represents ignition detection and one of the digital inputs 1 – 4 respectively. For each bit, 0 means disabled status and 1 means enabled status.
- ✧ <Digital Output>: A bitwise hex integer to represents the logical status of the digital output. From the lowest bit to the highest bit, each bit represents one of the digital outputs 1 – 4 respectively. For each bit, 0 means disabled status and 1 means enabled status

3.3.3. Report of Real Time Querying

3.3.3.1. +RESP:GTGPS

After the device receives the command **AT+GTRTO** to read the GPS information, it will send the GPS information to the backend server by the message **+RESP:GTGPS**.

➤ **+RESP:GTGPS,**

Example: +RESP:GTGPS,DC0100,862170019025640,,,,,0000,,0,20140511093254,20140511093254,11F0\$

- ✧ <Current Packet>: The sequence number of current packet.
- ✧ <Configurations>: The current configuration of the device. The 1st message contains configuration for the commands from **BSI** to **FRI**, the 2nd is for the commands from **GEO** to **DOG**, the 3rd is for the commands from **AIS** to **SSR**, the 4th to 7th are for the command **IDA**, the 8th is for the commands from **ACD** to **TMP**, the 9th is for the command **RMD**, the 10th to 13th messages are for the command **PEO**, the 14th is for the commands from **AEX** to **BAS**, the 15th is for the commands for **BID**, the 16th is for the commands from **GLM** to **GPJ**.

Note: The length of every **+RESP:GTALM** message (including header and tail) should be no more than 1500 characters.

3.3.3.3. +RESP:GTALC

After the device receives the command **AT+GTRTO** to read the configurations, it will send corresponding configuration information to the backend server by the message **+RESP:GTALC** according to the configuration mask. This message is only sent via GPRS even if the report mode is Force on SMS. The **+RESP:GTALC** does not support HEX report.

➤ **+RESP:GTALC,**

Tail Character	1	\$	\$

✧ <Next Packet>: Related information packet is complete or not.

- 0: There is a complete information packet.
- 1: There is not a complete information packet.

✧ <Current Packet>: This is the index of **+RESP:GTALC**.

3.3.3.4. +RESP:GTCID

After the device receives the command **AT+GTRTO** to read the ICCID of the SIM card, it will send the ICCID to the backend server by the message **+RESP:GTCID**.

➤ **+RESP:GTCID,**

Example: +RESP:GTCID,DC0100,862170019025640,,898600810906F8048812,20090214093254,11F0\$			
Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXFFFF, $X \in \{'A' - 'Z', '0' - '9'\}$	
Unique ID	15/12	IMEI/MUID	
Device Name	<=20	'0' – '9' 'a' – 'z' 'A' – 'Z' '-' '_'	
ICCID	20		
Send Time	14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

3.3.3.5. +RESP:GTCSQ

After the device receives the command **AT+GTRTO** to read the network signal level, it will send the network signal level to the backend server by the message **+RESP:GTCSQ**.

➤ **+RESP:GTCSQ,**

Example: +RESP:GTCSQ,DC0100,862170019025640,,16,0,20140511093254,11F0\$			
Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXFFFF, $X \in \{'A' - 'Z', '0' - '9'\}$	

Unique ID	15/12	IMEI/MUID	
Device Name	<=20	'0' – '9' 'a' – 'z' 'A' – 'Z' '-' '_'	
CSQ RSSI	<=2	0 – 31	
CSQ FER	<=2	0 – 7	
Send Time	0 14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

✧ <CSQ RSSI>: The signal strength level.

CSQ RSSI	Signal Strength (dBm)
0	<-133
1	-111
2 – 30	-109 – -53
31	>-51

✧ <CSQ FER>: The quality of the network signal. The range is 0-7.

3.3.3.6. +RESP:GTVR

After the device receives the command **AT+GTRTO** to get the versions (including firmware version, hardware version and module version), it will send the version information to the backend server by the message **+RESP:GTVR**.

➤ **+RESP:GTVR,**

Example: +RESP:GTVR,DC0100,862170019025640,,GV600,0101,0101,0101,20140511093254,11F0\$			
Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXXFFF, X ∈ {'A' – 'Z', '0' – '9'}	
Unique ID	15/12	IMEI/MUID	
Device Name	<=20	'0' – '9' 'a' – 'z' 'A' – 'Z' '-' '_'	
Device Type	10	'0' – '9' 'a' – 'z' 'A' – 'Z'	
Firmware Version	4	0000 – FFFF	
Hardware Version	4	0000 – FFFF	
Configuration Version	4	0000 – FFFF	
Modem Hardware Version	<=20		

Modem Software Version	<=50		
Send Time	0 14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

- ✧ <Device Type>: The type of the device.
- ✧ <Firmware Version>: The firmware version. The first two characters represent the major version and the last two characters represent the minor version. For example: **010A** means the version GV600R00A01V10.
- ✧ <Hardware Version>: The hardware version. The first two characters represent the major version and the last two characters represent the minor version. For example: **010A** means the version **1.10**.
- ✧ <Configuration Version>: The GTFVR configuration version. The first two characters represent the major version and the last two characters represent the minor version. For example: **0102** means the version **1.02**.
- ✧ <Modem Hardware Version>: The module model HL8518
- ✧ <Modem Software Version> : The software version of the modem, for example "RHL85xx.5.14.0.5.0. 20160401.x6255"

3.3.3.7. +RESP:GTBAT

After the device receives the command **AT+GTRTO** to read the power supply information, it will send the power supply information to the backend server by the message **+RESP:GTBAT**.

➤ +RESP:GTBAT,

Example: +RESP:GTBAT,DC0100,862170019025640,,10,12000,,4.40,0,0,20140511093254,11F0\$			
Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXFFFF, X ∈ {'A' – 'Z', '0' – '9'}	
Unique ID	15/12	IMEI/MUID	
Device Name	<=20	'0' – '9' 'a' – 'z' 'A' – 'Z' '-' '_'	
External Power Supply	2	00 01 10 11	
External Power VCC	<=5	0 – 32000mV	
External Power VCC2	<=5	0 – 32000mV	
Backup Battery VCC	<=4	0.00 – 4.50 V	
Charging	1	0 1	
LED On	1	0 1	

Send Time	0 14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

+RESP:GTIOS

After the device receives the command **AT+GTRTO** to get all the IO ports status, it will send the status to the backend server by the message **+RESP:GTIOS**.

➤ **+RESP:GTIOS,**

Example: +RESP:GTIOS,DC0100,862170019025640,,0,1200,1300,00,00,20140511093254,11F0\$			
Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXFFFF, X ∈ {'A' – 'Z','0' – '9'}	
Unique ID	15/12	IMEI/MUID	
Device Name	<=20	'0' – '9' 'a' – 'z' 'A' – 'Z' '-' '_'	
IO Mode	1	0-F	
Analog Input VCC1	<=4	0 – 32000 mV	
Reserved			
Digital Input	2	00 – 1F	
Digital Output	2	00 – 0F	
Send Time	0 14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

+RESP:GTTMZ

After the device receives the command **AT+GTRTO** to get the time zone settings, it will send the time zone information by the message **+RESP:GTTMZ** to the backend server.

➤ **+RESP:GTTMZ,**

Example: +RESP:GTTMZ,DC0100,862170019025640,,+0800,0,20090214093254,11F0\$			
Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXFFFF, X ∈ {'A' – 'Z','0' – '9'}	

Unique ID	15/12	IMEI/MUID	
Device Name	<=20	'0' – '9' 'a' – 'z' 'A' – 'Z' '-' '_'	
Time Zone Offset	5	±HHMM	
Daylight Saving	1	0 1	
Send Time	14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

+RESP:GTAIF

After the device receives the command **AT+GTRTO** to get the **AIF**, it will send the information by the message **+RESP:GTAIF** to the backend server. The **+RESP:GTAIF** does not support the HEX report.

➤ **+RESP:GTAIF,****Example:**

+RESP:GTAIF,DC0100,862170019025640,,,ctnet@mynet.cn,vnet.mobi,,,,,20,0,0358,10.194.113.168,211.138.180.2,211.136.17.108,,,,,20140511093254,0181\$

Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXFFFF, X ∈ {'A' – 'Z', '0' – '9'}	
Unique ID	15/12	IMEI/MUID	
Device Name	<=20	'0' – '9' 'a' – 'z' 'A' – 'Z' '-' '_'	
APN	<=40		
APN User Name	<=30

✧ <CSQ RSSI>: The signal strength level.

CSQ RSSI	Signal Strength (dBm)
0	<-133
1	-111
2 – 30	-109 – -53
31	>-51

✧ <CSQ FER>: The quality of the network signal. The range is 0-7.

✧ <Cell ID>: Cell ID in hex format.

✧ <IP Addr>: The IP address of the device.

✧ <Network Type>: Type of current registered mobile network.

- 0: 2G
- 2: LTE-4G/CAT-M1/NB1
- Other: Unregistered.

+RESP:GTALS

After the device receives the command **AT+GTRTO** to get sub AT command configuration information, it will send the configuration information to the backend server by the message **+RESP:GTALS**. Different AT Command gets different configuration information. For example, to get FRI configuration: **AT+GTRTO=gv600mg,2,FRI,,,,,0015\$**

➤ **+RESP:GTALS,**

Example: +RESP:GTALS,DC0100,862170019025640,gv600mg,FRI,1,0,,0,0000,0000,,30,1000,1000,,40,60,00000000,,,,20140511093254,00C3\$

Tail Character	1	\$	\$

3.3.3.8. +RESP:GTGSV

After the device receives the command AT+GTRTO to get the satellites information, it will send the satellites information by the message +RESP: GTGSV to the backend server.

➤ +RESP:GTGSV,

Example: +RESP:GTGSV,DC0100,862170019025640,,11,30,24,31,30,32,28,32,29,12,0,14,17,16,18,20,0,22,24,24,0,25,0,20140511093254,000F\$			
Parameter	Length (Byte)	Range/Format	Default

Protocol Version	6	XX0000 – XXFFFF, $X \in \{'A' - 'Z', '0' - '9'\}$	
Unique ID	15/12	IMEI/MUID	
Device name	20		
SV count	2	0-16	
SV id	2	> =0	
SV power	2	> =0	
.....			
SV id	2	> =0	
SV power	2	> =0	
Send Time	0 14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

- ✧ <SV count>: Number of satellites the GPS found.
- ✧ <SV id>: Satellite id, when no satellites, zero used as special number to fill.
- ✧ <SV power>: Satellite power, when no satellites, zero used as special number to fill.

3.3.3.9. +RESP:GTRSS

After the device receives the command **AT+GTRTO** to get the real time information of the temperature and motion sensor, it will send the information to the server by the report **+RESP:GTRSS**. The **+RESP:GTRSS** does not support HEX report.

➤ +RESP:GTRSS,

Example:

```
+RESP:GTRSS,DC0100,865284040834503,GV600MG,0,5,0,2898129F0A0000E0,26,,1,DD330A00
3466,23,,1,B84BA4B05FCD,26,,1,B84BA4BFF7D6,27,,1,B84BA4CFEC0C,26,,,,,20191105031740,0
A7C$
```

Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXFFFF, $X \in \{'A' - 'Z', '0' - '9'\}$	
Unique ID	15	IMEI	
Device Name	<=20	'0' – '9' 'a' – 'z' 'A' – 'Z' '-' '_'	
Motion Sensor Status	1	0 1	
Sensor Number	<=1	0-18	
Sensor Type(optional)	<=1		

Sensor ID(optional)	<=16		
Temperature(optional)	<=3	(-)XX	
Humidity(optional)	<=3	0-100	
Reserved	0		
Reserved	0		
Reserved	0		
Send Time	14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

✧ <Motion Sensor Status>:

- 0: motionless
- 1: motion

✧ <Sensor Number>: The number of temperature sensors.

If it is 0, the following fields <Sensor Type>, <Sensor ID>, <Temperature> and <Humidity> will not display. If there is more than one sensor, these fields will display to show the information of all connected sensors.

✧ <Sensor Type>: Means the type of the sensor.

- 0: 1-wire sensor
- 1: WTH300

✧ <Temperature>: the real time temperature.

✧ <Humidity>: the real time humidity, only supported by WTH300.

3.3.4. Event Report

The following event reports are triggered when certain events occur

+RESP:GTPNA: Power on report

+RESP:GTPFA: Power off report

+RESP:GTMPN: The report for connecting main power supply

+RESP:GTMPF: The report for disconnecting main power supply

+RESP:GTBTC: Backup battery starts charging report

+RESP:GTSTC: Backup battery stops charging report

+RESP:GTBPL: Backup battery low

+RESP:GTSTT: Device motion state indication when the motion state is changed

+RESP:GTPDP: GPRS connection establishment report

+RESP:GTIGN: Ignition on report

+RESP:GTIGF: Ignition off report

+RESP:GTIDN: Enter into idling status

+RESP:GTIDF: Leave idling status

+RESP:GTGPJ: GPS jamming status

+RESP:GTGSM: The report for the information of the serving cell and the neighbor cells, this report does not support the HEX format

+RESP:GTGSS: GPS signal status

+RESP:GTSTR: Vehicle enters into start status

+RESP:GTSTP: Vehicle enters into stop status

+RESP:GTLSP: Vehicle enters into long stop status.

+RESP:GTFLA: Unusual fuel consumption alarm

+RESP:GTDOS: Output status change with waveform 1

+RESP:GTTMP: Temperature alarm

+RESP:GTRMD: The report for entering or leaving GSM roaming state

+RESP:GTUPC: Reporting information about UPC

+RESP: GTVGN: Ignition on report

+RESP: GTVGF: Ignition off report

+RESP:GTEXP: Reporting malfunction information of digital fuel sensor

In **+RESP:GTMPN**, **+RESP:GTMPF**, **+RESP:GTBTC**, **+RESP:GTSTC**, **+RESP:GTBPL**, **+RESP:GTSTT**, **+RESP:GTIGN**, **+RESP:GTIGF**, **+RESP:GTVGN**, **+RESP:GTVGF**, **+RESP:GTIDN**, **+RESP:GTIDF**, **+RESP:GTGSS**, **+RESP:GTSTR**, **+RESP:GTSTP**, **+RESP:GTLSP**, **+RESP:GTFLA**, **+RESP:GTDOS** and **+RESP:GTTMP** event reports, the last known GPS information and the current network information are included.

➤ **+RESP:GTPNA**,

➤ **+RESP:GTPFA**,

➤ **+RESP:GTPDP**,

Example:

+RESP:GTPNA,DC0100,862170019025640,,20140511093254,11F0\$

+RESP:GTPFA,DC0100,862170019025640,,20140511093254,11F0\$

0: WKF300 (Keyfob).
 - The model of Beacon multi-functional sensor (<Accessory Type> is 6):
2: WTH300
 - 5: BLE lock
- ✧ <Accessory Model>: The model of the Bluetooth accessory which is defined in **AT+GTBAS**

and **AT+GTBID**.

- ✧ **<Alarm Type>**: The type of alarm which generated according to **<Sensor Type>** and **<Sensor Model>** specified in **AT+GTBAS** command.
 - 0: The voltage of the Bluetooth accessory is low.
 - 4. Push button event of WKF300 is detected.
 - 5. Unlock success.
 - 6. Unlock fail.
- ✧ **<Append Mask>**: Bitwise mask defined in **AT+GTBAS** and **AT+GTBID** commands to configure which data item is reported.
 - Bit 0: **<Accessory Name>**.
 - Bit 1: **<Accessory MAC>**.
 - Bit 2: **<Accessory Connection Status>**.
 - Bit 3: **<Accessory Voltage>**.
 - Bit 4: **<Accessory Temperature>**.
- ✧ **<Accessory Name>**: Bluetooth accessory Name.
- ✧ **<Accessory MAC>**: Bluetooth accessory MAC address.
- ✧ **<Accessory Connection Status>**: It indicates the connection status of Bluetooth accessory.
 - 0: Disconnected.
 - 1: Connected.
- ✧ **<Accessory Voltage>**: The voltage of Bluetooth accessory.
- ✧ **<Accessory Temperature>**: Temperature data of Bluetooth accessory.

 - 300: The device starts to update the device configuration.
 - 301: The device finishes updating the device configuration successfully.
 - 302: The device fails to update the device configuration.
- ✧ **<Download URL>**: The complete URL to download the configuration. It includes the file name.

3.3.5. Data Report

The following report will be triggered when certain data needs to be sent.

➤ **+RESP:GTFSD,**

This report is used for reporting fuel sensor data.

Example: +RESP:GTFSD,ED2001,862170016790444,,39,*QL,407D,01,00000,0132,0014,00000,0229#,,,,,20141021021206,0018\$			
Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXFFFF, X ∈ {'A' – 'Z', '0' – '9'}	
Unique ID	15/12	IMEI/MUID	
Device Name	<=20	'0' – '9' 'a' – 'z' 'A' – 'Z' '-' '_'	
Data Length	2		
Sensor Data	<=128	ASCII Code	
Reserved	0		
Reserved	0		
Reserved	0		
Reserved	0		
Send Time	14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Characters	1	\$	\$

- ✧ **<Data Length>**: The length of <Sensor Data>.
- ✧ **<Sensor Data>**: The fuel data from fuel sensor. It starts with '*QL' and ends with '#'.

3.3.6. Buffer Report

If the buffer report function is enabled by command **AT+GTSRI**, the terminal will save the messages in a local buffer when the following occurs.

- ✧ No network signal.
- ✧ Failed to activate network context for the TCP or UDP connection.
- ✧ Network Failed to establish the TCP connection with the backend server.

These messages will be sent to the backend server when connection to the server recovers. The buffer reports are saved to the built-in non-volatile memory in case the device is reset. The terminal can buffer up to 10000 messages.

Detailed information about buffer report is listed below.

- ✧ Only **+RESP** messages are buffered.
- ✧ In the buffer report, the original header string "**+RESP**" is replaced by "**+BUFF**". Other contents such as the original sending time and count number will be kept the same.
- ✧ Buffered messages will be sent only via network by TCP or UDP protocol. They cannot be sent via SMS. If the current report mode is Force on SMS, the buffered messages will not be sent until the report mode is changed to TCP or UDP.
- ✧ The buffered messages will be sent after other normal messages if *<Buffer Mode>* in **AT+GTSRI** is set to 1.
- ✧ The buffered messages will be sent before other normal messages if *<Buffer Mode>* in **AT+GTSRI** is set to 2. The SOS message has the highest priority and is sent before the buffered messages.

Example:

The following is an example of the buffered message:

```
+BUFF:GTFRI,DC0100,862170019025640,,,00,,1,4.3,92,70.0,121.354335,31.222073,20140511093254,0460,0003,36100010,014B,00,2000.0,12345:12:34,,,80,210100,,,20140511093254,11F0$
```

3.3.7. Transparent Data Transmission

The device supports transparent transfer between the backend server and the peripheral device connected to its second serial port. gv600mg supports bi-directional data transmission. In both directions, the data is transmitted to the device via transparent transfer.

a) Transfer data from the peripheral device to the backend server

According to the *<working mode>* of the command **AT+GTMUT**, there are two ways for the peripheral device communicates with gv600mg.

If the peripheral device supports **AT+GTDAT** command, it can transfer data via this command. The peripheral device can send command **AT+GTDAT** with the data to the serial port. According to the *<Command Type>* of **AT+GTDAT**, The device wraps the corresponding data format into backend server with **+RESP: GTDAT** message either in short format or in long format.

b) Transfer data from the backend server to the peripheral device

If the backend server needs to send data to the peripheral device, it can send command **AT+GTDAT** with the data to gv600mg and gv600mg will pick out the pure data and send it to the

second serial port. In this way the peripheral device can get the data from the serial port.

Data to the backend server

➤ **+RESP:GTDAT (Short Format),**

Example: +RESP:GTDAT,DC0100,862170019025640,,data,20140511093254,0017\$			
Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXFFFF, $X \in \{'A' - 'Z', '0' - '9'\}$	
Unique ID	15/12	IMEI/MUID	
Device Name	<=20	'0' – '9' 'a' – 'z' 'A' – 'Z' '-' '_'	
Data to the Backend Server	<=1280	ASCII Code	
Send Time	0 14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

➤ **+RESP:GTDAT (Long Format)**

Example: +RESP:GTDAT,DC0100,862170019025640,,3,,,1645026150,0,0.5,0,29.4,121.390923,31.164295,20111222022935,0460,0003,36100010,014B,00,,,,,20140511093254,001A\$			
Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXFFFF, $X \in \{'A' - 'Z', '0' - '9'\}$	
Unique ID	15/12	IMEI/MUID	
Device Name	<=20	'0' – '9' 'a' – 'z' 'A' – 'Z' '-' '_'	
Report Type	1	0 1 2	
Reserved	0		
Reserved	0		
Data to the Backend Server	<=1280	ASCII Code	
GPS Accuracy	<=2	0	0, Last known
Speed	<=5	0.0 – 999.9 km/h	
Azimuth	<=3	0 – 359	

Altitude	<=8	(-)xxxxx.x m	
Longitude	<=11	(-)xxx.xxxxxx	
Latitude	<=10	(-)xx.xxxxxx	
GPS UTC Time	14	YYYYMMDDHHMMSS	
MCC	0 4	0XXX	
MNC	0 4	0XXX	
LAC	0 4	XXXX	
Cell ID	0 4 8	XXXXXXXX	
Reserved	0 2	00	00
Reserved	0		
Reserved	0		
Reserved	0		
Reserved	0		
Send Time	0 14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

✧ <Report Type>: The value of <Report Type> refers to <Working Mode> of **AT+GTMUT**.

- 0: Disable the second serial port.
- 1: AT+GTDAT.
- 2: Reserve.

Data to the second serial port starts with a new line and ends with '\r\n'.

Example:

Data to the serial port

3.3.8. Report Google Maps Hyperlink

According to the setting of the command **AT+GTGLM** or SMS position request message via SMS, the device can send a SMS with Google Maps hyperlink to a mobile phone.

If the device receives SMS position request message via SMS, gv600mg will send its current position to the original number via SMS with a Google Maps hyperlink if the original number is a direct number (please refer to <Direct Number List> in the Chapter 3.2.7.6) or a number in the white list (please refer to <White List> in the Chapter 3.2.7.5)

gv600mg will send an SMS with a Google Maps hyperlink to the direct phone numbers after the messages +RESP:GTSOS and +RESP:GTGIN/+RESP:GTGOT.

➤ Google Maps Hyperlink

Example: LBC:gv600mg http://maps.google.com/maps?q=31.222073,121.354335 F1 D2009/01/01 T00:00:00 B0% I1 S0.0			
Parameter	Length (Byte)	Range/Format	Default
SMS Header	<=30	'0' – '9' 'a' – 'z' 'A' – 'Z' '-' ' ' '_'	
Google Maps Hyperlink Header	30	http://maps.google.com/maps?q=	http://maps.google.com/maps?q=
Latitude	<=10	(-)xx.xxxxxx	
Longitude	<=11	(-)xxx.xxxxxx	
GPS Fix	<=3	F0 F1	
GPS UTC Time	20	DYYYY/MM/DDTHH:MM:SS	
Battery Percentage	<=6	B0%-B100%	
Ignition Status	2	I0 I1	
Speed	<=6	S0.0 – S999.9 km/h	

- ✧ <SMS Header>: A string that includes the terminal name and GPS fix type ("SOS", "IN GEO-i", "OUT GEO-i", "LBC").
- ✧ <Google Maps Hyperlink>: A string of a Google Maps hyperlink.
- ✧ <GPS Fix>: The accuracy of the location information. F0 means no GPS fix.
- ✧ <Battery Percentage>: The percentage of the backup battery.
- ✧ <Ignition Status>: The status of ignition. 0 means ignition off and 1 means ignition on.
- ✧ <Speed>: The current speed. Unit: km/h.

3.4. Heartbeat

Heartbeat is used to maintain the contact between the device and the backend server via network. The heartbeat package is sent to the backend server at the interval defined by *<Heartbeat Interval>* in **AT+GTSRI** command.

➤ +ACK:GTHBD

Example: +ACK:GTHBD,DC0100,862170019025640,,20140511093254,11F0\$			
Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXXFFF, X ∈ {'A' – 'Z', '0' – '9'}	
Unique ID	15/12	IMEI/MUID	
Device Name	<=20	'0' – '9' 'a' – 'z' 'A' – 'Z' '-' '_'	
Send Time	14	YYYYMMDDHHMMSS	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

Whenever the backend server receives a heartbeat package, it should reply an acknowledgement to the device.

➤ +SACK:GTHBD

Example: +SACK:GTHBD,DC0100,11F0\$ +SACK:GTHBD,,11F0\$			
Parameter	Length (Byte)	Range/Format	Default
Protocol Version	6	XX0000 – XXXFFF, X ∈ {'A' – 'Z', '0' – '9'}	
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

- ✧ *<Protocol Version>*: The device type and the protocol version that the backend server supports. This field is optional. The backend server can send an empty field to decrease the length of the heartbeat data acknowledgement.
- ✧ *<Count Number>*: Extracted from the heartbeat package from the device as the *<Count Number>* of the server acknowledgement of the heartbeat.

3.5. Server Acknowledgement

If server acknowledgement is enabled by **AT+GTSRI** command, the backend server will reply to the device whenever it receives a message from the device.

➤ **+SACK:**

Example: +SACK:11F0\$			
Parameter	Length (Byte)	Range/Format	Default
Count Number	4	0000 – FFFF	
Tail Character	1	\$	\$

- ✧ *<Count Number>*: The backend server uses the *<Count Number>* extracted from the received message as the *<Count Number>* in the server acknowledgement.

4. HEX Format Report Message

From this version, the @Tracker protocol supports messages in HEX format. For all the commands, they still use the ASCII format as described above. By default the device uses ASCII format messages. The backend server could use **AT+GTQSS** or **AT+GTSRI** command to enable the HEX format messages by setting the *<Protocol Format>* to 1.

All the messages are sorted into 5 categories (acknowledgement to command (**+ACK**), location report (**+RSP**), event report (**+EVT**), information report (**+INF**) and the heartbeat packet data (**+HBD**)). Reports of the same category have the same header string.

The composition of the HEX message could be customized by **AT+GTHRM** command. The actual length of each HEX report depends on the setting of the masks in **AT+GTHRM**.

The device uses CRC-CCITT (0xFFFF) method to calculate the checksum of the report data and appends the checksum to the end of the data. The backend server could use this checksum to verify the integrity of the received data.

At the end of each HEX message, the device uses 0x0D and 0x0A as the end.

The HEX messages are transmitted in network byte order (big-endian).

4.1. Hex Report Mask

AT+GTHRM command uses <+ACK Mask>, <+RSP Mask>, <+EVT Mask>, <+INF Mask> and <+HBD Mask> to control the composition of the corresponding HEX message. In each HEX message, the corresponding mask for the report is included to indicate which part is reported.

➤ AT+GTHRM=

Example: AT+GTHRM=gv600mg,,,7F,FEFFFF,FEFFFF,2F7F,FF,,7F,,,0018\$			
Parameter	Length (Byte)	Range/Format	Default
Password	4 – 7	'0' – '9' 'a' – 'z' 'A' – 'Z'	gv600mg
Reserved	0		
Reserved	0		
+ACK Mask	2	00 – FF	7F
+RSP Mask	8	00000000 – FFFFFFFF	FEFFFF
+EVT Mask	8	00000000 – FFFFFFFF	FEFFFF
+INF Mask	<=8	00000000 – FFFFFFFF	2F7F
+HBD Mask	2	00 – FF	FF

- ✧ **<Report Mask>**: It refers to the **<+ACK Mask>** in **AT+GTHRM**.
- ✧ **<Length>**: The length of the acknowledgement message (total characters from header to the tail).
- ✧ **<Unique ID>**: When “MUID Enable” in AT+GTCFG is 0, if Bit 4 of **<+ACK Mask>** is 0, IMEI of the device will be used as the unique ID of the device. IMEI is a 15-digit string. In the HEX format message, every 2 digits are encoded into one byte as an integer.

IMEI	13	57	90	24	68	11	22	0
HEX	0D	39	5A	18	44	0B	16	00

When “MUID Enable” in AT+GTCFG is 1, if the Bit 4 of **<+ACK Mask>** is 0, MUID of the device is used as the unique ID of the device. The length of MUID is 12 bytes.

When “MUID Enable” in AT+GTCFG is 0, if the Bit 4 of **<+ACK Mask>** is 1, the device name is used as the unique ID of the device. Refer to the **<Device Name>** in **AT+GTCFG** for the device name. Device name is an 8-byte string. If the length of the **<Device Name>** is more than 8 bytes, only the first 8 bytes will be acquired. In the Hex format message, each byte is encoded into one byte as an integer. If the device name is less than 8 bytes, the empty bytes will be set to 0.

Device Name	g	v	6	0	0	m	g	
HEX	67	76	36	30	30	6D	67	00

When “MUID Enable” in AT+GTCFG is 1, if the Bit 4 of **<+ACK Mask>** is 1, the length of **<Device Name>** will become 12 bytes.

- ✧ **<ID>**: Sub-command ID of **AT+GTRTO** or the ID of **AT+GTIOB** and **AT+GTGEO**. Set it to 0 for other reports.
- ✧ **<Send Time>**: The local time to send the acknowledgement message. Total 7 bytes. The first 2 bytes are for year, the rest 5 bytes are for month, day, hour, minute and second respectively.

Send Time	2011		01	31	06	29	11
HEX	07	DB	01	1F	06	1D	0B

- ✧ **<Checksum>**: The CRC-CCITT (0xFFFF) checksum for data from **<Message Type>** to **<Count Number>**.

4.3. Location Report +RSP

Location messages (including +RESP:GTPNL, +RESP:GTTOW, +RESP:GTAIS, +RESP:GTDIS, +RESP:GTIOB, +RESP:GTFRI, +RESP:GTSPD, +RESP:GTRTL, +RESP:GTDG, +RESP:GTIGL, and +RESP:GTEPS) use this format.

- ✧ <Report Mask>: It refers to the <+RSP Mask> in **AT+GTHRM**.
- ✧ <Unique ID>: When “MUID Enable” in AT+GTCFG is 0, if the Bit 6 of <+RSP Mask> is 0, IMEI of the device is used as the unique ID of the device. IMEI is a 15-digit string. In the HEX format message, every 2 digits are encoded into one byte as an integer.

IMEI	13	57	90	24	68	11	22	0
HEX	0D	39	5A	18	44	0B	16	00

When “MUID Enable” in AT+GTCFG is 1, if the Bit 6 of <+RSP Mask> is 0, MUID of the device is used as the unique ID of the device. The length of MUID is 12 bytes.

When “MUID Enable” in AT+GTCFG is 0, if the Bit 6 of <+RSP Mask> is 1, the device name is used as the unique ID of the device. Refer to the <Device Name> in **AT+GTCFG** for the device name. Device name is an 8-byte string. If the length of the <Device Name> is more than 8 bytes, only the first 8 bytes will be acquired. In the Hex format report, each byte is encoded into one byte as an integer. If the device name is less than 8 bytes, the empty bytes will be set to 0.

Device Name	g	v	6	0	0	m	g	
-------------	---	---	---	---	---	---	---	--

HEX	67	76	36	30	30	6D	67	00
-----	----	----	----	----	----	----	----	----

When "MUID Enable" in AT+GTCFG is 1, if the Bit 6 of <+RSP Mask> is 1, the length of <Device Name> will become 12 bytes.

- ✧ <Digit & Analog Input Mode>: The mode of the digital and analog input ports, the high byte is for digital IO mode and the low 4 bits of the low byte are for the analog input 1.
- ✧ <Digital Input Status>: The mask of digital input1, digital input2, digital input3 and digital input4 status.

Input status mask	ID
Ignition Detection	0x01
Digital Input1	0x02
Digital Input2	0x04
Digital Input3	0x08
Digital Input4	0x10

- ✧ <Digital Output Status>: The mask of digital output1, digital output2, digital output3 and relay output status.

Input status mask	ID
Digital Output1	0x01
Digital Output2	0x02
Digital Output3	0x04
Digital Output4	0x08

- ✧ <Satellites>: Number of GPS Satellites.
- ✧ <Report ID/Report Type>: The high nibble is for <Report ID> and the low nibble is for <Report Type>.
- ✧ <Speed>: Total 3 bytes. The first two bytes are for the integer part of the speed and the last byte is for the fraction part. The fraction part has only 1 digit.
- ✧ <Longitude>: The longitude of the current position. Total 4 bytes. The longitude is converted to an integer with 6 implicit decimals and this integer is reported in HEX format. If the value of the longitude is negative, it is represented in 2's complement format.

Longitude	121390847			
121.390847				
HEX	07	3C	46	FF

- ✧ <Latitude>: The latitude of the current position. Total 4 bytes. The latitude is converted to an integer with 6 implicit decimals and this integer is reported in HEX format. If the value of the latitude is negative, it is represented in 2's complement format.

Latitude	31164503			
31.164503				
HEX	01	DB	88	57

- ✧ <GPS UTC Time>: The UTC time from the GPS chip. Total 7 bytes. The first 2 bytes are for year, the rest 5 bytes for month, day, hour, minute and second respectively.

GPS UTC Time	2011	07	14	08	24	13
HEX	07	DB	07	0E	08	0D

- ✧ <Current Mileage>: Total 3 bytes. The first 2 bytes are for the integer part of the current mileage and the last byte is for the fraction part. The fraction part has only 1 digit.

Current Mileage	0	0
HEX	00	00

- ✧ <Total Mileage>: Total 5 bytes. The first 4 bytes are for the integer part of the total mileage and the last byte is for the fraction part. The fraction part has only 1 digit.

Total Mileage	0	0
HEX	00	00

- ✧ <Total Hour Meter Count>: Total 6 bytes. The first 4 bytes are the hour part. The fifth byte is the minute part. The sixth byte is the second part.

Total Hour Meter Count	0	0	0	0
HEX	00	00	00	00

Location message for +RESP:GTSOS uses below format.

Tail Characters		2	0x0D 0x0A	0x0D 0x0A

✧ <UART Device Type>: Type of device connected to the second serial port.

● 0: No device connect

✧ <1-Wire Devices ID>: Means the 1-Wire device ID read from the device.

- ✧ <1-Wire Devices TYPE>: Means the 1-Wire device type.
 - 1: Temperature sensor.
 - ✧ <Device Data Length>: It indicates the length of <1-Wire Devices DATA>.
 - ✧ <1-Wire Devices DATA>: Means the data read from the 1-Wire devices. If the value of <1-Wire Devices Type> is the temperature sensor, this indicates the temperature value. To convert the value of the two bytes in hex to decimal, multiply it by 0.0625 to get the temperature value in Celsius degrees. If the first 5 bits of the high byte are 1, the temperature value is below zero Celsius degrees and the value is represented in two's complement format. To obtain the temperature in decimal, plus the hexadecimal data by 1 and then multiply it by 0.0625 to get the value in Celsius degrees.
 - ✧ <Bluetooth Accessory Number>: It indicates the number of accessories connected with the device.
 - ✧ <Index>: There are two meaning for <Index>.
 - The index of Bluetooth accessory defined in **AT+GTBAS** which triggers the **+RESP:GTBAA** message.
 - 0xFF for WKF300.
 - ✧ <Accessory Type>: The type of the Bluetooth accessory which is defined in the <Index>. The following is supported now:
 - 0: No Bluetooth accessory.
 - 1: Reserved.
 - 2: Beacon temperature sensor.
 - 3: BLE beacon ID device.
 - ✧ <Accessory Model>: The model of the Bluetooth accessory which is defined in **AT+GTBAS** and **AT+GTBID**.
 - ✧ <Raw Data Length>: It indicates the length of <Raw Data>.
 - ✧ <Raw Data>: The data is read from Bluetooth accessory. It varies depending on <Accessory Type> and <Accessory Model>.
 - ✧ <Accessory Name>: The name of the Bluetooth accessory. It ends with 0x00.
 - ✧ <Accessory MAC>: The MAC address of the Bluetooth accessory.
 - ✧ <Accessory Connection Status>: It indicates the connection status of Bluetooth accessory.
 - 0: Disconnected.
 - 1: Connected.
 - ✧ <Accessory Voltage>: The voltage of Bluetooth accessory.
 - ✧ <Accessory Temperature>: Temperature data of Bluetooth accessory.
 - ✧ <Accessory Output status>: Extended output status of Bluetooth accessory.
 - ✧ <Accessory Digital Input status>: Extended digital input status of Bluetooth accessory.
 - ✧ <Accessory Analog Input voltage>: Extended analog input voltage of Bluetooth accessory.
- Note:** The key word (optional) means the item is controlled by the parameter <ERI Mask>.

Location messages for **+RESP:GTGIN** and **+RESP:GTGOT** use this format.

- ✧ **<Area Type>**: This text belongs to Polygon or circle area, 0 means Polygon.
- ✧ **<Group Mask>**: The bitwise mask to confirm the reported **<GEO ID Group>**. For gv600mg, only bit 0 is valid and it should be set to 1.
- ✧ **<GEO ID Group>**: The bitwise mask for trigger condition composition of the corresponding GEO ID. For gv600mg, only the lowest 20 bits are valid. Each bit, from bit 0 to bit 19, represents the logical status of the corresponding GEO ID to trigger the entering or exiting event. 1 means that the event of the GEO ID set has been triggered and 0 means has not.

✧ *<Report Mask>*: It refers to the *<+INF Mask>* in **AT+GTHRM**.

✧ *<Unique ID>*: When “MUID Enable” in AT+GTCFG is 0, if the Bit 1 of *<+INF Mask>* is 0, IMEI of the device is used as the unique ID. IMEI has 14 bytes in hexadecimal format. In the Hex format message, every two bytes are encoded into one byte as an integer. The 8th byte is reserved and its value is 0x00.

IMEI	13	57	90	24	68	11	22	0
HEX	0D	39	5A	18	44	0B	16	00

When “MUID Enable” in AT+GTCFG is 1, if the Bit 1 of *<+INF Mask>* is 0, MUID of the device is used as the unique ID of the device. The length of MUID is 12 bytes.

When “MUID Enable” in AT+GTCFG is 0, if the Bit 1 of <+INF Mask> is 1, the device name is used as the unique ID of the device. Refer to the <Device Name> in **AT+GTCFG** for the device name. Device name is an 8-byte string. If the length of the <Device Name> is more than 8 bytes, only the first 8 bytes will be acquired. In the Hex format report, each byte is encoded into one byte as an integer. If the device name is less than 8 bytes, the empty bytes will be set to 0.

Device Name	g	v	6	0	0	m	g	
HEX	67	76	36	30	30	6D	67	00

When “MUID Enable” in AT+GTCFG is 1, if the Bit 1 of <+INF Mask> is 1, the length of <Device Name> will become 12 bytes.

- ✧ <Power Saving Enable/OWH Mode/Outside Working Hours/AGPS>: The highest bit, bit 7 is reserved. Bit 5 and bit 6 are for <Power Saving Enable>, bit 4 and bit 3 are for <OWH Mode>, bit 2 is for <Outside Working Hours> and bit 0 is for <AGPS>. <Outside Working Hours> is used to indicate whether the device is currently outside the working hours. 1 means it is outside the working hours.
- ✧ <Main Supply/Backup Battery On/Charging/LED On/Backup Battery Charge Mode>: The highest bit, bit 7 is for <Main Supply> to indicate whether the external power supply is connected to the device. Bit 6 is for <Backup Battery On> to indicate whether the backup battery is working. Bit 5 is for <Charging> to indicate whether the backup battery is currently charging. Bit 4 is for <LED On> to indicate whether the LEDs are turned on. Bit 0 is for <Backup Battery Charge Mode>.
- ✧ <ICCID>: ICCID is a 20-digit string. In the HEX format message, every 4 bits are used to represent one digit of the ICCID.

ICCID	89	86	00	00	09	09	17	21	49	53
HEX	89	86	00	00	09	09	17	21	49	53

- ✧ <Time Zone Offset Sign/Enable Daylight Saving>: Bit 1 is for <Enable Daylight Saving> which indicates whether the daylight saving function is currently enabled. Bit 0 is for <Time Zone Offset Sign> which indicates the positive or negative offset of the local time to UTC. 1 means “negative offset”.
- ✧ <Cell Number>: It represents the number of the IMSI. The IMSI consists of MCC, MNC, LAC, and Cell ID.

4.5. Event Report +EVT

Event messages (+RESP:GTPNA, +RESP:GTPFA, +RESP:GTMPN, +RESP:GTMPF, +RESP:GTBTC, +RESP:GTSTC, +RESP:GTSTT, +RESP:GTGPJ, +RESP:GTPDP, +RESP:GTIDN, +RESP:GTSTR, +RESP:GTSTP, +RESP:GTLSP) use this format.

- ✧ **<Report Mask>**: It refers to the **<+EVT Mask>** in **AT+GTHRM**.
- ✧ **<Unique ID>**: When “MUID Enable” in AT+GTCFG is 0, if the Bit 6 of **<+EVT Mask>** is 0, IMEI of the device is used as the unique ID of the device. IMEI is a 15-digit string. In the HEX format message, every 2 digits are encoded into one byte as an integer.

IMEI	13	57	90	24	68	11	22	0
HEX	0D	39	5A	18	44	0B	16	00

When “MUID Enable” in AT+GTCFG is 1, if the Bit 6 of **<+EVT Mask>** is 0, MUID of the device is used as the unique ID of the device. The length of MUID is 12 bytes.

When “MUID Enable” in AT+GTCFG is 0, if the Bit 6 of **<+EVT Mask>** is 1, the device name is used as the unique ID of the device. Refer to the **<Device Name>** in **AT+GTCFG** for the device name. Device name is an 8-byte string. If the length of the **<Device Name>** is more than 8 bytes, only the first 8 bytes will be acquired. In the Hex format report, each byte is encoded into one byte as an integer. If the device name is less than 8 bytes, the empty bytes will be set to 0.

Device Name	g	v	6	0	0	m	g	
HEX	67	76	36	30	30	6D	67	00

When “MUID Enable” in AT+GTCFG is 1, if the Bit 6 of **<+EVT Mask>** is 1, the length of **<Device Name>** will become 12 bytes.

Event message **+RESP:GTBPL** uses this format.

➤ **+EVT,**

Example:

- ✧ <Command ID>: The command ID in the update configuration file. It is always 0 before the device starts to update the configuration. It indicates the total number of the successfully executed commands when the result code is 301. And it is the number of the commands which have failed to execute when the result code is 302.
- ✧ <Result>: A numeral to indicate whether the configuration is updated successfully.
 - 100: The update command is starting.
 - 101: The update command is confirmed by the device.

- 102: The update command is refused by the device.
- 103: The update process is refused because the battery is low.
- 200: The device starts to download the package.
- 201: The device finishes downloading the package successfully.
- 202: The device fails to download the package.
- 300: The device starts to update the device configuration.
- 301: The device finishes updating the device configuration successfully.
- 302: The device fails to update the device configuration.
- ✧ <URL Length>: The length of complete URL.
- ✧ <Download URL>: The complete URL to download the configuration. It includes the file name.

Event message **+RESP:GTUPD** uses this format. For this message, the <Protocol Version> and <Firmware Version> will always be present regardless the <Report Items Mask> setting.

4.7. Heartbeat Data +HBD

➤ +HBD,

Example:

2B 48 42 44 EF 20 DC 01 00 01 02 56 34 54 04 08 2F 53 06 07 E3 0A 16 02 0C 0F 08 D7 36 5C 0D 0A

Parameter	Length (Byte)	Range/Format	Default
Message Header	4	+HBD	+HBD
Report Mask	1	00 – FF	
Length	1		
Device Type	1	DC	DC
Protocol Version	2	0000 – FFFF	
Firmware Version	2	0000 – FFFF	
Unique ID	8/12	IMEI/MUID/Device Name	
Send Time	7	YYYYMMDDHHMMSS	
Count Number	2	0000 – FFFF	
Checksum	2	0000 – FFFF	
Tail Characters	2	0x0D 0x0A	0x0D 0x0A

- ✧ <Report Mask>: It refers to the <+HBD Mask> in **AT+GTHRM**.
- ✧ <Unique ID>: If Bit 4 of <+HBD Mask> is 0, IMEI of the device is used as the unique ID of the device. IMEI is a 15-digit string. In the HEX format message, every 2 digits are encoded into one byte as an integer.

IMEI	13	57	90	24	68	11	22	0
HEX	0D	39	5A	18	44	0B	16	00

If the Bit 4 of <+HBD Mask> is 1, the device name is used as the unique ID of the device. Refer to the <Device Name> in **AT+GTCFG** for the device name. Device name is an 8-byte string. If the length of the <Device Name> is more than 8 bytes, only the first 8 bytes will be acquired. In the Hex format report, each byte is encoded into one byte as an integer. If the device name is less than 8 bytes, the empty bytes will be set to 0.

Device Name	g	v	6	0	0	m	g	
HEX	67	76	36	30	30	6D	67	00

If the mask of <UID> is set to 0 in the <+HBD Mask> of **AT+GTHRM**, the heartbeat message will not report device name or IMEI information. If the mask of <UID> is set to 1, the heartbeat message will send device name or IMEI according to the mask of <Device Name>.

4.8. Buffer Report in HEX Format

When HEX format messages are buffered in the memory, the device will replace the second byte of the messages with 'B'. Thus, **+BSP** is buffered report for **+RSP**, **+BNF** is buffered report for **+INF** and **+BVT** is buffered report for **+EVT**. The rest part of the messages is the same.
